# At Borland we speak

NOW  
£59.95

**Whatever the language, whether you're a novice or experienced programmer — Borland products are the right ones for you. They're all Turbo charged to give greater speed and power, they're simple to use and what's more, they'll make you work faster.**

**Our success in the language environment is clear, with over 1 million people using our programming languages; Turbo Pascal, Turbo Prolog, Turbo Basic and Turbo C and their accompanying toolboxes.**

**Our strong commitment to excellence has led our products to become industry leaders. We set the Pascal, Prolog, Basic and C standards worldwide, but we're not complacent. Our pledge is to innovative, high quality products — providing you, the user, with tomorrow's technology, today. But don't take our word for it! Take a look at these products and see for yourself how well we speak your language.**

## ▶ TURBO PROLOG

*Takes Programming into a New Dimension*

Turbo Prolog is a fifth-generation computer language that takes programming into a new dimension. It brings supercomputer power to your IBM PC, and introduces you step-by-step to the fascinating new world of artificial intelligence. Because of its natural, logical approach, both people new to programming and professional programmers can build powerful applications with Turbo Prolog — such as expert systems, customised knowledge bases, natural language interfaces, and smart information-management systems.

Voted Top Programming Language Year.  
*What Micro, February 1988*

*Turbo Prolog Provides a Fully Integrated Programming Environment*

Turbo Prolog is a declarative language — given the necessary facts and rules. Turbo Prolog uses deductive reasoning to solve programming problems. Like Borland's Turbo Pascal, the de facto worldwide Pascal standard, Turbo Prolog provides a fully integrated programming environment. A full-screen text editor works with the compiler to produce flawless source code.

Prolog Technical Features:

- has a complete set of predicates for external database management
- allows the declaration of local internal databases
- allows constant definitions
- provides facilities for conditional compilation
- has an error trapping standard predicate
- has the ability to handle new EGA text modes
- incorporates other new standard predicates
- has several editor enhancements
- has improved window handling
- runs on the new IBM PS/2 videocards.

"Turbo Prolog is more than just a language compiler. It is a complete development environment, and at about £70 is very good value."  
*Phil Manchester, PC, September 1986*

### TURBO PROLOG TOOLBOX

Our new Turbo Prolog Toolbox enhances Turbo Prolog — with

more than 80 tools and over 8,000 lines of source code that can easily be incorporated into your programs. It includes about 40 example programs that show you how to use and incorporate your new tools.

"It is the first compiler to bring this fascinating 'artificial intelligence' language within the range of the smaller users. It has a faster and neater programming environment than many of the expensive Prolog systems. Moreover, the compiled programs execute at a surprisingly fast speed."

*What Micro? Top Ten, February 1988*

## ▶ TURBO BASIC

*The High Speed Basic You'd Expect from Borland*

Turbo Basic is the high speed BASIC compiler you've been waiting for. And it's so fast that you'll never have to wait again. It roars at a speed of up to 12,000 lines per minute.

Turbo Basic is a complete development environment which includes a lightning fast compiler, an interactive editor, and a trace debugging system.

Turbo Basic supports the Hercules Colour Graphics card and an Enhanced Graphics Adapter card, enabling you to produce sophisticated graphics in record time.

"Turbo Basic is a world away from the traditional free standing compilers, with their need for separate editors and linkers. Compile, link, run and crash — can be performed quickly and easily in an integrated environment, complete with windows and pull down menus".  
*Practical Computing, August 1987*

### Anyone Can Program in Basic

Turbo Basic has been designed to allow everyone to program in BASIC at breakneck pace. Whether you've been programming in BASIC for a long time or whether you've just begun — having the fastest BASIC to program in is an absolute must. Turbo Basic's integrated design

# nk your language

NOW  
£59.95

## BASIC

permits quick program turn-around without sacrificing the powerful features experienced programmers demand.

### A Technical Look At Turbo Basic

- Full recursion supported
- Standard IEEE floating-point format
- Floating-point support with full 8087 (math co-processor) integration. Software emulation if no 8087 present.
- Program size limited only by available memory (no 64K limitation)
- EGA and CGA support
- Access to local, static and global variables.
- Full integration of the compiler, editor, and executable program, with separate windows for editing, messages, tracing, and execution.
- Compile run-time, and 110 errors place you in the source code where error occurred.
- New long integer (32 bit) data type.
- Full 80 bit precision.
- Full window management.

### Turbo Basic Toolboxes Make Basic Work For You

**TURBO BASIC EDITOR TOOLBOX** is a powerful collection of procedures and functions for

building a superfast editor to incorporate into your Turbo Basic programs.

**TURBO BASIC DATABASE TOOLBOX** helps you to build your own powerful database programs without

wasting time writing routines.

NOW  
£59.95

## TURBO C

*A Quarter of a Million Users Can't Be Wrong!*

Our Turbo C compiler is without doubt the most popular C compiler in the world. Since its launch it has quickly become the worldwide standard, respected and used by a quarter of a million professionals and novices alike. And now we've made it even better!

Turbo C 1.5 combines ease of use with speed of compilation and offers a new library of the highest presentation-quality graphics in the industry.

Its speed of compilation means you don't have to sit around waiting for hours to remove syntax errors from your program. Turbo C 1.5 does it all in one go — and amazingly fast. And yet we've made it so easy to use that everyone, from the professional programmer to the first time user, can benefit from its excellence.

"It should be quite clear by now that I am impressed, this system (Turbo C) is very, very good indeed — I've used it every working day since it was available."

*Doug Kaye, Personal Computing With the Amstrad, December 1987*

*Turbo C 1.5 Offers Spectacular Graphics*

Turbo C 1.5 provides a professional-quality graphics library of over 70 new functions which enable you to produce

professional graphics in a short time, without purchasing any additional libraries.

Enhancements in Turbo C 1.5 include:

- More than 100 new functions.
- On-line help for the library routines.
- Sample graphics applications.
- VGA, CGA, EGA, Hercules and IBM 8514 support.
- 43- and 50-line mode support.
- Text/video functions, including windows.
- A librarian that allows you to build your own object module libraries.
- File search utility (GREP).

"Turbo C also lived up to its 'Turbo' label when running the PCW Benchmarks. In all tests bar one (Textscrn), the Borland product came out on top."

Nick Walker, Personal Computer World, September 1987.

NEW  
VERSION 1.5  
WITH 100 NEW FUNCTIONS

# World leaders in their own right

---

“There are no prizes for guessing which is the computer language that revolutionised programming at the serious end of the microcomputer world — it's Turbo Pascal . . .”

*Owen Linderholm, PCW, December 1987*

---

# Personal Computer World

## DELL SYSTEM 200

96

The Dell System 200 might not be the first IBM PS/2 compatible, but it does have a configuration obviously suited to Microsoft's OS/2. Four megabytes of RAM, an incredibly fast hard disk, and VGA graphics — all at an extremely competitive price. Peter Jackson Benchtests the machine which will interest the OS/2 crowd.

Cover photography by Chris Bell  
Thanks to Phoenix the Panther

## FEATURES AND REVIEWS

## MICROSOFT BOOKSHELF

102

How would you like a dictionary, a thesaurus, an almanac and four other reference books all available at the click of a mouse. With Microsoft Bookshelf on CD-ROM, this has become a reality. David Tebbutt explores this first general-purpose compact disc application.

## PC/AT TOOLBOXES

108

Peter Jackson takes a look at three very different solutions to the problem of squeezing full desktop AT capabilities into a portable box. The NEC, Sharp and Walters toolbox ATs are put through the paces of a full-blown PCW Benchtest.

## MICRO MIDGET

116

The Micro Midget must be one of the smallest fully-configured PCs available, and could be the answer for those with no room for a desktop computer. Martin Wren-Hilton clears a square foot of desk space to Benchtest this diminutive, Amstrad-priced PC.

## CANON BUBBLEJET

120

Simon Jones looks at a new and promising printer technology in the form of the Canon Bubblejet, which 'boils' the ink onto the paper. For less than half the price of a laser printer, the bubble jet offers better resolution, equal print quality and significantly less cost per page.

## WAITING FOR A MIRACLE

124

Dick Pountain discovers the real truth behind the promises of IBM and Microsoft with their new operating system, OS/2. True, it offers multi-tasking and freedom from the 640k DOS barrier, but at what cost? Read this in-depth feature for the full, grizzly facts.

## A WINDOW INTO THE BRAIN

130

You don't need a Cray supercomputer to do research into artificial intelligence and pattern recognition. Jack Weber explains how a neural network pattern recognition can be implemented on most micros,

# REGULARS

## NEWSPRINT 70

Intel's 386/PC, Amstrad's PPC bundle and Turbo Pascal 4 come under Guy Kewney's scrutiny this month.

## WEST COAST CONNECTION 85

Reports from MacWorld and CES, and what Steve Jobs is doing neXT.

## LETTERS 91

Martin Banks takes the brunt of this month's reader reactions, but gives as good as he gets.

## BANKS' STATEMENT 94

Greed is the main driving force in the computer industry, argues Martin Banks.

## SCREENPLAY 160

Stephen Applebaum picks the best of this month's games.

## BIBLIOFILE 164

Supplement your operating system's manual with some of this month's books.

## MUSICAL INTERLUDE 170

New online music services, and a Basic program to monitor your MIDI.

## MAILBOX 174

Peter Tootill unravels the mystique of modem terminology.

## SUBSET 178

David Barrow presents two graphics routines for the 8086/88 processor.

## PROGRAM FILE 180

Atari ST Fast Basic is put to use creating astounding graphics in an event-driven program.

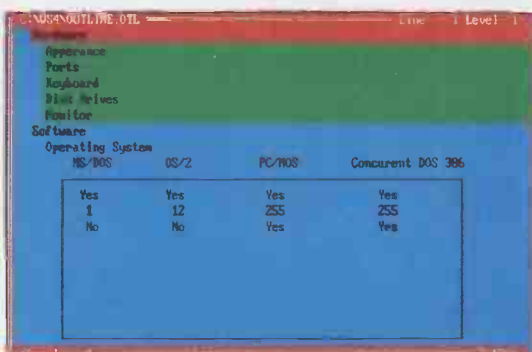

## END ZONE 210

Directories of user groups, bulletin boards and exhibitions alongside our small ads and problem page.

## CHIPCHAT

Who's made a fool of themselves in the industry this month?

# FEATURES AND REVIEWS

## SIDEKICK PLUS 136

Confirmed SideKick addict Dick Pountain takes a look at the latest 'pop-up' from Borland. Long awaited, SideKick Plus offers so many more features than its predecessor, it is perhaps better considered as a fully-customisable, 'pop-up', integrated software package in its own right.

## HOLIDAY IN METROPOLIS 142

It's nice to see that some large and complex programs are still programmed from start to finish by one individual. Graham Devine describes the production of his game, Metropolis, from the original artwork two years ago to the finished product.

## JPI MODULA-2 146

JPI Modula-2 compiles at 'Turbo' speed and has a strangely familiar interface. Owen Linderholm takes a closer look at this competitively-priced and very capable implementation.

## TALKING PICTURES 150

In this month's Teach Yourself episode, Carl Phillips describes how the WIMP interface is intrinsically part of the Smalltalk system.

## STOP PRESS 156

Tired of the dull-looking pages of text that appear from your Amstrad PCW? With AMS Stop Press, you can convert the machine into a low-end but competent desktop publishing system. Ross Blackman put the system through its paces.

# WARRANTY

# IF WITHIN 7 DAYS, THE DIFFERENCE WILL BE REFUNDED

# BACKUP your troubles **£29.95** in your old **CLIP** bag!

## CLIP — THE BACKUP PROGRAM STANDARD

### The PROBLEM —

Your free backup utility is slow, difficult to use, and can only restore files into ready-made directories.

It does not record its progress — so you backup everything to be safe.

Or nothing because it's such a bore.

CLIP has the longest track record of all backup programs and an enviable reputation for reliable service. Purchasers of 1000+ copies of CLIP include British Telecom, Philips and Ashton-Tate.

Only the best will do for backup.

### The SOLUTION —

CLIP keeps a log of its backups, so you can afford to be selective.

It maintains a menu of your customised commands, so you do not have to stop and think. It is fast, and it compresses data.

Result — fewer disks, less time, less effort, no worry, greater security.

- ★ High-speed data compression
- ★ Execute by highly visual Menu or by command line entry
- ★ On-line help at every point
- ★ Can select new files only
- ★ Multiple wildcard select, include or exclude basis.
- ★ Save to any media-floppy, hardcard Bernoulli etc
- ★ Save to remote/network drive
- ★ Restores directories + files
- ★ Recovery after media errors
- ★ Log of all backup operations

For an experimental period, CLIP 4.0L is offered at £29.95, (The previous advertised price was £67.85). Order now and prove that the trial price is the right one for you and us.

Available for PC/XT/AT and compatibles, PCDOS/MSDOS  
Price includes VAT and UK postage. c.w.o. or Access

# The **TWIN** Classic

**£59.95**  
excl V.A.T.

**The TWIN is a very powerful and easy-to-use business software program for your PC. It is especially designed to provide you with the ultimate in both spreadsheet and high quality presentation graphics.**

- Compatible with Lotus 1-2-3®
- High quality presentation-level graphics
- Reads and writes 1-2-3® files directly
- 1-2-3® Macro compatible
- Site licensing plans available
- No copy protection

- No copy protection for full backup and use of hard disk
- Supports the 8087 coprocessor chip for faster calculation
- Spreadsheet can import its own print files and 1-2-3 print files
- Displays available memory on status line
- User selectable 16 colour display for spreadsheet and graphics
- Financial functions which are not available in 1-2-3 are: IRR, NPER, and RATE
- Bi-level analysis and presentation-level graphics
- Up to 15 different types of graphs
- 11 text fonts displayable on screen
- 2 and 3 dimensional graphs
- Horizontal bar charts
- Pie-bar combination graphs
- Logarithmic scales
- 2 vertical Y axes
- Optional "Fill in the blanks" input forms for complete user control on all graph attributes
- On-screen slide presentation
- Single or sequence of graphs
- Simple configuration of hardware
- Point at range names
- Meaning of function keys is displayed in ready mode
- Space/backspace operate cursor movement in flip menus
- Reads and writes DIF files without leaving program
- Full documentation and Tutorial

## PC MAGAZINE

"Companies currently using 1-2-3® could safely introduce TWIN into the same environment. In spreadsheet and database functions it is true 1-2-3® clone. Represents excellent value for the money. A powerful spreadsheet with very good graphics."

Since its introduction in the UK in June 1987 the TWIN Classic has been adopted by hundreds of leading UK organisations including Times Top 1000 companies, government departments as well as many universities and colleges. These join over 200,000 MosaicSoftware users worldwide in over 20 countries. Many foreign language versions of the TWIN Classic are available — including French, German, Italian, Spanish, Danish, Chinese.

The TWIN Classic is just one of the outstanding products from Mosaic. Others are: Chartman — for five years a leading business graphics program, and Integrated 7 — the popular integrated program.

MOSAIC and the TWIN are trademarks of MOSAIC SOFTWARE INC. Other brand and product names are trademarks of their respective holders.

# SUPER LABELLER

## Fast . . . Flexible . . . Efficient . . . THE PROFESSIONAL LABELLING SYSTEM

### PRINTING

- UNRIVALLED printing facilities are provided offering TOTAL FLEXIBILITY. These include:
  - PRINT A SINGLE LABEL ANY NUMBER OF TIMES
  - PRINT GROUPS OF LABELS USING "WILDCARDS" ANY NUMBER OF TIMES
  - PRINT GROUPS OF LABELS SPECIFYING THE NUMBER TO PRINT FOR EACH LABEL
  - PRINT ACCORDING TO SEARCH CRITERIA ANY NUMBER OF TIMES
  - PRINT ANY LINES OF THE LABELS IN ANY ORDER
  - IGNORE ANY LINES OF THE LABEL
  - PRINT ONTO ANY SIZE LABEL
  - ANY NUMBER ACROSS THE WEB
  - ANY MARGIN SPACE AND GAP SETTINGS
  - ANY TYPESTYLE YOUR PRINTER IS CAPABLE OF (INCLUDING COLOUR)
  - PAUSE PRINTING BETWEEN EACH LABEL
  - DIFFERENT TYPESTYLES AND BARCODES MAY BE MIXED ON THE SAME LINE WITHOUT EFFECTING ACROSS THE WEB PRINTING
  - PRINTOUTS CAN BE AS LABELS, A COLUMNISED LIST OR COMPRESSED (SCRUNCHED) FORMAT USING ANY LINES OF THE LABEL IN ANY ORDER.
  - OUTPUT CAN BE SENT TO A FILE, ANY PRINTER OR SCREEN.
- A UNIQUE feature to SUPER LABELLER is the REQUEST command. This allows text to be merged into a label or text file "LIVE" from the keyboard while printing.

### BAR CODES

BAR CODES are offered as an option and once again offers TOTAL FLEXIBILITY.

BAR CODE formats can be defined EASILY in a FEW MINUTES and stored on disc for use at any time. An UNLIMITED number of different BAR CODE standards can be created or indeed your own system can be designed.

BAR CODES are printed using the graphic capabilities of your printer and may be positioned anywhere on the label freely mixed in with normal text, WITHOUT effecting across the web printing.

The BAR CODE RATIO is user definable, to give a magnification effect.

### MAIL MERGE

As well as addressing your envelopes, SUPER LABELLER incorporates a comprehensive MAIL MERGE facility which will accept ANY standard text file.

You can merge in:

- ANY LINES OF A LABEL, ANY NUMBER OF TIMES IN ANY ORDER.
- DAYS, DATES AND TIMES.
- PRE-SET MESSAGES (16).
- SERIAL NUMBERS (2).
- PRINTER CONTROL CODES (UNLIMITED).
- BAR CODES (UNLIMITED).

In fact ALL the advanced features available for use on a label are also available to use with MAIL MERGE.

ANY number of copies of the text file can be specified and output can be sent to the SCREEN, PRINTER or FILE.

Labels for merging can be selected by "WILDCARDS", INDIVIDUALLY or by GROUP allowing for UNLIMITED CATEGORISATION.

Furthermore the advanced SEARCHING FACILITIES allow selected data to be found and merged according to virtually UNLIMITED criteria.

### SERIAL NUMBERING

SERIAL NUMBERING is an important feature of SUPER LABELLER and this facility is TOTALLY CONFIGURABLE.

There are TWO INDEPENDENT SERIAL NUMBERS associated with each label file and each can individually be set to have its own characteristics.

- START AT ANY NUMBER
- ANY NUMBER BASE
- ANY INCREMENT (+ or -)
- ANY NUMBER OF LABELS WITH THE SAME NUMBER
- FORMATTED TO ANY NUMBER OF DIGITS BETWEEN 2 AND 12
- LAST NUMBERS SAVED WITH FILE

### FILES

Each group of labels are stored together in a common file and there may be as many files as will fit on your disc.

ANY file can hold up to TEN THOUSAND labels, all held automatically in SORTED ORDER by name.

Typically, even with TEN THOUSAND labels in a file, SEARCHING and SORTING takes no more than a FEW SECONDS.

A new file can be set up in SECONDS and requires NO COMPLEX CONFIGURATION. Indeed you only need to specify the maximum characters required per label and the name you wish to call your file.

All these options are available:

- CREATE FILE
- DELETE FILE
- LIST FILES
- SELECT FILE
- ADD A LABEL
- ADD LABELS IN BATCHES FOR SUPER FAST DATA ENTRY
- CHANGE LABEL DETAILS
- DELETE LABELS
- RENAME LABEL
- RE-CATEGORISE LABELS

### SEARCHING

SUPER LABELLER incorporates an ADVANCED ENGLISH TEXT SEARCH feature allowing for multiple AND OR and NOT (AVOID) operations. Below is an ACTUAL EXAMPLE of this facility to demonstrate the power.

IGNORE CASE

PLEASE FIND HOUSE ON LINES 1, 2  
OR FIND BUNGALOW ON LINE 1  
BUT AVOID FLAT ON ALL LINES  
AND FIND LONDON ON LINES 1, 6, 8  
BUT AVOID CHELSEA AND AVOID ISLINGTON

This can be used both for SELECTIVE PRINTING of labels and MAILMERGE. Furthermore this can be combined with the "WILDCARD" feature to allow UNLIMITED CATEGORISING.

### LABEL EDITING

A BARRAGE of editing facilities are available to SUPER LABELLER to ease data entry and modification. It includes features that would compare favourably with many word processors as well as DEDICATED FUNCTIONS designed specifically for use with labels. The list includes:

VISIT A LABEL - Allows you, while editing, to quickly visit another label (for example to view the contents or to cut and paste) and then return to the original.

COPY CURSER - AN EXTREMELY USEFUL aid to editing which allows a secondary cursor to move freely anywhere on the screen and "pick-up" characters as though they had been typed. This keeps TYPING TO A MINIMUM by avoiding the need to retype duplicated words or sentences.

It is also used to pick up graphic characters to be used for drawing.

FIND AND REPLACE TEXT - This can be performed by scanning both FORWARD and BACKWARD through the labels.

CHANGE SIZE OF LABEL - The size of the label can be changed at ANY TIME from within the editor at a key stroke.

EXPANSION KEYS - The ten function keys can be set so a single keypress "EXPANDS" into a WORD or SENTENCE again to minimise typing.

QUICK SHOT - Allows the current label being edited to be printed to see instant results.

### EMBEDDED COMMANDS

SUPER LABELLER offers many special features by allowing COMMANDS to be embedded within a label or text file. This offers print time facilities of UNRIVALLED FLEXIBILITY. For instance:

- TWO INDIVIDUAL SERIAL NUMBERS
- DATE AND DAY STAMPING
- TIME STAMPING
- REQUEST TEXT FROM KEYBOARD DURING PRINTING
- BAR CODES
- MERGE PRE-DEFINED TEXT
- PRINTER CONTROL CODES

COMPLETE control over the printer is allowed by USER DEFINABLE PRINT CODES. Furthermore, the COMMANDS for each printer function can have any name you choose. This allows customisation of any special facilities your printer provides. If your printer supports colour you could create COMMANDS such as RED, GREEN, BLUE and so on.

### IMPORTANT

SUPER LABELLER is the culmination of TWO AND A HALF YEARS of producing FAST, EASY TO USE, SPECIALIST LABELLING SOFTWARE.

First time users are guided through the program with PULL DOWN MENUS and EXTENSIVE HELP.

Experienced operators have the UNPRECEDENTED opportunity to leave the menu system and PROGRAM DIRECTLY using the powerful MASS-FORTH operating system, allowing new commands to be created at will.

### DRAWING UTILITY

All printable characters are available for use on a-label and selection of the required graphics character comes from an EASY TO USE PULL DOWN GRAPHICS CHARACTER WINDOW.

The cursor keys are used to "DRAW" your designs. This feature can also be used to obtain FOREIGN CHARACTERS that are not normally available from the keyboard.

# MULTIBUFFER: THE ULTIMATE PRINTER PLOTTER SHARER

## User-configurable for future requirements

The MULTIBUFFER can be factory- or user-configured with 1-7 plug-in interface cards for up to 7 parallel ports or 14 serial ports, or a combination of parallel and serial. Each serial card provides two data ports. Data direction (input/output) of each port is selectable and all common baud rates and handshakes are supported.

## All users can send data simultaneously

Each port is separately buffered, allowing simultaneous data flow on all input and output ports. Installed ports can be used for any combination of PCs, printers and plotters.

## Up to FOUR MEGABYTES buffer memory

With advanced high-speed algorithms, buffer memory is automatically allocated and deallocated to each user in

real time from a common 'pool' of up to 4MB. A limit can be set on maximum memory per user.

## Simple but powerful menu-driven set-up

All user-configurable features of the MULTIBUFFER are accessed via a user-friendly menu-driven program running on a PC. No fiddly switches are used. Also, when the MULTIBUFFER is driven from several PCs, each PC user can activate a RAM-resident pop-down menu for printer selection and other useful functions. Setups can be stored in non-volatile memory.

## Highest-ever data throughput

State-of the art high speed 16-bit CMOS technology allows up to 13 input ports to receive data simultaneously at a full 9600 baud without slowing-down the PCs – much faster than other printer sharers. Data rates up to 38400 baud (serial) and 30000 bytes/sec (parallel) are possible – ideal for laser printers and DTP systems such as Ventura or Pagemaker. The MULTIBUFFER can often eliminate a much more costly printer-sharing network.

## New British-made universal buffered printer/plotter sharer and data switch

- Up to 14 user-installable serial and/or parallel ports.
- ALL INPUT/OUTPUT PORTS CAN BE ACTIVE SIMULTANEOUSLY.
- Up to 4 MEGABYTES of common memory, automatically allocated and deallocated as required on each active port.
- SEVERAL PCs CAN SHARE ONE OR MORE PRINTERS OR PLOTTERS.
- ANY PC CAN ACCESS ANY PRINTER OR PLOTTER.

## OTHER DATA COMMS PRODUCTS AVAILABLE FROM RINGDALE INCLUDE

### MEGABUFFER – Universal Data Buffer

- Reduces computer waiting time while printing/plotting.
- Allows you to use your PC more.
- New battery backup version.
- Compatible with most computers, printers and plotters.
- Software – independent.
- Data buffer and interface converter.
- 64K – £160; 128K – £216; 256K – £278; 512K – £388; 1024K – £498.

### MEGASWITCH AS – Serial Data Selector

- Single unit multiplexer and demultiplexer with 2K buffer.
- RS-232 and RS-422 versions.
- Multiplexer – ideal for printer sharing. 4 Inputs, 2 outputs. Can automatically select any channel supplying data.
- Demultiplexer – ideal for driving several different printers from a PC. 2 inputs and 4 outputs.
- Software and manual selection. RS232 version – £169

### MEGASWITCH AP – Parallel Data Selector

- Connects any of 4 inputs to one of 2 outputs.
- Can automatically switch to any channel supplying data.
- Ideal for laser printer sharing.
- Universally compatible – works with all standard Centronic computer and printer interfaces.
- Use it with a Megabuffer for additional time saving – £169

## The perfect choice for CAD

The MULTIBUFFER can allow THIRTEEN PCs to share a plotter – or 10 PCs to share 4 plotters, and so on. You can now optimise the utilisation of a single high-performance plotter with AutoCAD, Robocad, Redboard and most other popular CAD programs.

## MULTIBUFFER PRICES

1/2MB	1MB	2MB	4MB	Serial Card	Parallel Card
£475	£575	£1225	£2225	£80	£40

## More Great BARGAINS!

**LOW,  
LOW  
Prices!**

### AMAZING VALUE COPAL PRINTERS

80 and 136 column 9 pin dot matrix printers

From **£139**

Just look at the spec.

- ★ Parallel Interface
- ★ Extended Warranty Available
- ★ High speed draft printing 180cps
- ★ NLQ printing at 35cps
- ★ Built in tractor feed
- ★ Epson or IBM Graphics compatibility
- ★ Exceptional value with 12 months warranty.

If you are fed up with paying over the odds just to get a well known printer, then consider the COPAL printers. Copal Electronics of Japan make printers for the big names in the printer world. When you buy a COPAL printer from SCS you are paying only for a high quality printer and not the label. The only decision to make is whether you need a narrow (80 column) or wide (136 column) model.

Item	Price	Price for 4+
Copal SC1500 80 column printer (Epson)	139.00	125.00
Copal SC1500 80 column printer (IBM)	144.00	130.00

Parallel printer cable (IBM compatibles)	£9.90
Parallel printer cable (BBC)	£7.50
Printer ribbons for FX105 (pack of 4)	each £3.70

**Why Buy an Epson?**

Why buy unheard of clones when you can be up there with the market leaders and still save money. This FABULOUS IBM COMPATIBLE really packs in all the features you will ever need, and still allows room for expansion. With the switchable processor you can treble the speed of an XT, thus saving valuable time on those big spreadsheets or databases. When you come to upgrade to colour there is no need to buy an additional adaptor. The Epson has it as standard. DON'T FORGET you get the high resolution Hercules graphics facility as standard. This PC will even turn itself ON or OFF under software control.

# Any company can take the IBM PS/2 apart. Only one can put it all together.

The moment IBM introduced the IBM Personal System/2™ family, the race was on to copy or “clone” the new technology.

Easier said than done. And here's why.

When IBM set out to make the new computers, we could have simply installed a more powerful chip into our top PC performer, as some computer companies are doing.

To us, that's just pushing an older technology to its limits.

Instead, we broke ground with a new technology. One that would maintain links to earlier PCs, meet our customers' needs for more power and performance, and serve as a platform for future growth.

For instance, you wanted us to give you more standard features, and we did, but not by plugging cards into the machine.

Instead, we came up with a quieter, more reliable, more compact solution – a single board with printer, communication and mouse ports, even advanced graphics, built in.

In fact, the entire technology was developed from a “total system” philosophy – using IBM components, and IBM chips, specially designed and integrated to send overall performance and reliability up, and costs down.

We could even have been content to direct information through a traditional “single bus” highway. Instead we created a superhighway called MicroChannel™ Architecture in Models 50, 60 and 80, a much more efficient method of

sending and receiving information.

We also introduced a new version of DOS which taps into the power of the new systems and runs current applications software better. And we unveiled a new operating system; IBM Operating System/2™ that opens up a world of possibilities.

For starters, it's compatible with today's DOS, protecting your investment in hardware and software.

It works beautifully with MicroChannel, making it easier to do many jobs at once. What's more, OS/2 establishes a consistent look for virtually all software and systems, part of a blueprint for the future we call Systems Application Architecture.

Even IBM's experienced dealer network has been improved. Extensive education and training on both PS/2 and OS/2 ensure service and support are even stronger.

In fact, support comes from many sources, right now hundreds of outside developers are creating new cards, software and peripherals.

So you see, the world of the Personal System/2 is far greater than any single computer or chip or component.

And if you try taking apart a system like this, please remember that only one company can put it all together.

For more information, please write to Rosemary Gold at IBM United Kingdom Limited, FREEPOST, London W4 5BR, or telephone her on 01-578 4399 during working hours.

# LIFETREE SOFTWARE. HARD WORKING BUT NOT HARD LABOUR.

We believe powerfully featured programs shouldn't be hard to use. That's why we always create products with a single set of design rules in mind. Simplicity, safety, and power.

Volkswriter 3 and Volkswriter Deluxe, for example, require the fewest keystrokes per function of any word processors. Quick reference on-screen menus ensure you can be confident about every step. While you can feel safe from risking valuable data should you hit a wrong key.

Both Volkswriter 3 and Volkswriter Deluxe may be simple to use, but they have features that make more expensive word processors seem inadequate.

Similarly, Words & Figures is our Lotus 1-2-3 compatible spreadsheet with built-in word processor that

the experienced will find both easy to use and powerful, while the new user will enjoy the nationwide backup that compatibility with the industry standard allows.

And we believe our three tutorial programs, Learn to Type, Learn to Use Your PC, and Learn to Use DOS are a must for all first time computer users.

With prices ranging from £24.95 up to £199 (ex VAT) getting value for money couldn't be simpler.

And we don't sell you short on backup either.

All our products come with full lifetime telephone support, not the usual 90 days.

To find out more, talk to your local dealer. Or complete and return the coupon today. And discover software that'll take the hard labour out of your working day.

WORDS & FIGURES™ £99 + VAT. VOLKSWRITER DELUXE™ £44.95 INC VAT. VOLKSWRITER 3™ £199 + VAT. TUTORIALS £24.95 INC VAT EACH. LOTUS 1-2-3 IS A TRADEMARK OF LOTUS DEVELOPMENT CORP.

Yes, I would like to find out how to avoid hard labour. Please send me further information on the following products:

Volkswriter Deluxe  Volkswriter 3  Words & Figures

The "Learn to..." Tutorials  All products

Please send details of my nearest dealer.

**CL SERIES**

### XEROX VENTURA DESK TOP PUBLISHER (VERSION 1.1)

Desk Top Publishing (DTP) is the latest industry buzzword. There are a lot of packages about, but the general consensus is that this is the best. **£469.00**

### WESTERN DIGITAL 32MB HARD DISK CARD

This hard card is revolutionizing hard disk upgrades in the U.S. and U.K. Why? Because it's cheap! It is also easy to install, reasonably fast (65ms) and readily available. Takes up one and a half slots and works great in the Amstrad, IBM, Olivetti. You name it. Comes with the famous X-Tree organizing software which normally sells for £42. You won't find this top product selling anywhere cheaper. Hurry while stocks last! **£239.00**

### EXPRESS PC

This Taiwanese-built clone is manufactured for our Holland branch, where it has been so successful that we are introducing it here. Featuring AT-style keyboard, 640K, Hercules monochrome graphics and monitor, MS-DOS 3.2, 8088 Turbo processor and IBM-style box, its a classic design at a classic price.

Double floppy.....**£599.00**  
32mb version.....**£799.00**

### EPSON GQ3500

Now at last there is a quality laser almost anyone can afford, from a name-brand manufacturer at the lowest price on the market! Six pages per minute, wide choice of fonts, great print quality, cheap consumables! We're really shipping these out fast! **£1275.00**

### BORLAND QUATTRO

Is this the spreadsheet that will finally de-throne Lotus and SuperCalc? With this spec and price, maybe. It sold 50,000 copies in the first two weeks after its release in the U.S.

Special Introductory Offer **£129.00**

### EXPRESS AT

Manufactured by Supercorn of Taiwan, this 8MHz 80286 comes with a choice of classic or mini box with plenty of slots, parallel and serial ports, Real Time clock, MS-DOS 3.2, Hercules style monochrome graphics and monitor, AT keyboard. With this machine we break the psychological £1200 barrier on hard disk AT's (though not by much!)

32mb Express Mini AT.....**£1250.00**  
32mb Express AT.....**£1299.00**

### PANASONIC 1081

This 120cps draft/30cps NLQ little beast is a surprising winner. It continues to sell very well, no doubt helped by the fact that everybody (led by us!) discounts it so massively! But it has excellent 9-pin quality, is Epson and IBM compatible, comes with a tractor feed, is 80 columns wide and amazingly cheap! Has helped to up Panasonic's U.K. market share greatly! **£142.00**

### EPSON PC RANGE

This range is robust and sets the standard for design and style, while remaining easy on the pocketbook. The PCe is a turbo 8088 which comes complete with AT-style keyboard, DOS and monitor. The AT-style AX range comes with keyboard and MS-DOS, but you need to pay extra for the monitor and graphics adaptor board of your choice. The AX is a popular item for power users on a budget, such as local authorities!

PCe.....**£925.00**  
AX20 mk II.....**£1299.00**  
AX40.....**£1629.00**

### SHARP PORTABLES

This is the range that is going to give overpriced Toshiba a run for their money. The Laptop 4500 series offers excellent value and 4 hour battery life, while the hard disk 7100 and 7200 remain tied to the mains. All sport excellent back-lit supertwist LCD screens. The 4500's are 8088 turbo based with 3.5in floppies, while the 8086 7100 has a 20mb hard disk and single 5.25in floppy, as does the 80286 AT 7200.

PC-4501.....**£699.00**  
PC-7100.....**£1399.00**  
PC-7200.....**£2099.00**

### AMSTRAD 1640

No listing would be complete without mention of this machine. The shortcomings of the 1512 have been rectified and the 1640 is excellent value for money, coming as it does with an 8086 8MHz chip, 640K RAM, mouse, Gem, MS-DOS and choice of Hercules mono, full colour or EGA screen. The old 1512 was selling massively in this country, and the successor 1640 is having similar success. For real value buy the single drive version and add a 32mb FileCard!

Single Floppy ECD.....**£749.00**  
Single Floppy Mono.....**£465.00**  
20mb Hard Disk ECD.....**£1099.00**

### NEC P7 PINWRITER

Heavy duty 24-pin dot-matrix prints draft at 180cps and Letter Quality (LQ) at 72cps. A very successful product in the corporate sector. 132 column. **£441.00**

### EPSON LX800

Although previous LX series printers were considered under-specified compared to the NL10 and others and tended to sell more on name than on spec, the range continues to be the best seller ever, and the LX-800 not only outsells everything in sight but offers a specification that is better than most competitors at this price. This latest offering zips along at 150cps draft and 25cps NLQ and comes with Parallel Esc-P or IBM Parallel interfaces as standard, plus a top-mounted tractor feed. Good, clear typeface, 80 column wide. **£179.00**

### EPSON LQ2500

Although very expensive, this fast (270cps, 72cps LQ) printer continues to sell in impressive numbers even in the face of strong competition in a fiercely contested market segment. Probably the best printer Epson ever made. 24 pin printing, 132 column with built-in tractor feed. **£699.00**

### COMPUTER EXPRESS GOLD

This special value added service which includes delivery, installation, training, hot-line support and on-site maintenance is now available. Ask for details when placing your order.

### EPSON FX800/1000

No printer propaganda would be complete without listing the FX series. It was on the back of this range and its ancestors that Epson came to dominate the market. The 800 is the descendent of the 80 and 85, prints draft at 200cps and NLQ at 40cps and is 80 columns wide. The 1000's parents were the famous 100 and 105. It goes at the same speed and is 132 columns wide. Both include tractor feeds and Epson/IBM compatibility. Worthy pedigrees and a safe 9-pin choice. The absolute top sellers in the world at this time.

FX800.....**£294.00**  
FX1000.....**£380.00**

### LOTUS 1-2-3 (VERSION 2.01)

Although imitated by half a dozen cheaper workalikes, the original business spreadsheet continues to out-sell all of its rivals and is the Number One selling software package ever. Very popular with corporates and government. Our huge volumes enable us to offer it at an exceptionally low price. No one undercuts us on this. **£218.00**

### SUPERCALC 4

If you want an alternative to Lotus 1-2-3 and its clones, this is the only one worth considering. They say it is everything Lotus should have been. Easy to use and quick, good graphics, it may be number two, but it tries harder! **£189.00**

### WORD PERFECT (VERSION 4.1)

Statistics show that more Word Processing software is sold than any other kind. Word Perfect is the best selling WP package in the world today - full stop. It is also, in the view of most trade people, the best. Strongly recommended. In software terms, only Lotus outsells it. **£219.00**

### SMART SYSTEM

The trouble with integrated packages is that they tend to do one thing at most very well, and all the others not so well as a dedicated package. Smart is the only integrated system in which all of its components (WP, Spreadsheet, Database, Graphics, Communications, Diary) are competent to stand on their own against the competition. The best-selling integrated package. It retails at £695, but we sell it at nearly half that! **£359.00**

### MIRACLE WS4000 V21/V23 Modem

This is the most popular Modem in the country today because it is cheap, reliable, looks good and does the job, which is really quite a simple one, after all. You can use it to access Telecom Gold, One-to-One, EasyLink, Prestel and all the bulletin boards that keep sprouting up. You also need a serial cable (£15.00) and software. We recommend SageSoft ChitChat (£69.00) because that package also allows you to access Prestel. Most others don't. **£139.00**

### STAR LC10

Brand new! This is the successor to the NL10, which was the best-selling printer Star ever made. Although a 9-pin, it features a super dense matrix spread which gives it the best ever quality on a printer in its price range. Not only that, but you can print on single sheets without having to remove your continuous paper! **£189.00**

### EXPRESS TOWER 386

This price doesn't include monitor or hard disk, but 16MHz 80386, mono graphics card, 1.5mb RAM and one 1.2mb floppy. This has to be the cheapest 386 around. Perfect for networking!  
Express Tower 386.....**£1799.00**

**ESTABLISHED 1979**

## LOW-LOW-LOW-COST PROGRAMS

Out of the thousands of programs we have collected, for a small service charge from £6 we bring you a SELECTION OF THE BEST that have been carefully tested and documented. Suit IBM-PC and compatibles. 5 1/4" and 3 1/2". Dos 2 or greater.

Please note that in those instances where Basic is required, users should have Basic, GWBasic, or our shareware compatible version on disk M9001. Basic2 is not suitable.

Our games disks have a CGA emulator so those with Hercules boards can also play.

### MS-DOS GAMES

- M1006: CHESS. Several extensive versions with graphics. Includes Mychess. Well written.
- M1008: SELECTED FAMILY FUN GAMES. 2 Flight Simulators, Music generator, excellent Pacgirl, Space Wars, etc. Some need Basic.
- M1022: SUPER COMPILED GAMES (3). Arcade-type games. Includes Kong, Striker, Spacevade, Life2 and Frog.
- M1041: GAMES OF STRATEGY (1). Match wits in a Naval Battle Simulation, Big Truck haulage Business, and the Stock Market.
- M1046: SUPER COMPILED GAMES (5). With World Domination (Risk), Beast, Rockets, Subchase, etc.
- M1051: 50 BASIC GAMES. Includes a Startrek, Swarm, Baseball, Hobbit, Blackfri, Antonyms, many more. Needs Basic.
- M1068: STRIP POKER. An exciting way to pass an hour or two. If only you had partners like these! Needs Basic.
- M1070: PROVOCATIVE PICTURES (3). A collection of girlie pics with Mac-type graphics. Some animated. Not for children.
- M1078: WORLD GENERATOR FOR GAMES. Produces solar systems for science-fiction role-playing games. Generates, edits, stores systems and maps.
- M1079: GAMES FOR THE UNDER B'S (2). Suits young children. Pacman-type, plus entertaining educational games for alphabet, counting, adding, subtracting, telling time.
- M1080: RAILROAD SIMULATION. For all kids at heart! On screen tracks and animation. Choose a variety of tracks, redirect the train etc, etc.
- M1081: PROVOCATIVE PICTURES (4) - 1988 CALENDAR GIRLS. Sixteen different girls immodestly illustrate 12 months calendar for 1988. Pin-ups for printing.
- M1082: SUPER COMPILED GAMES (B). Arcade-type versions of 21 (ponton), Lazy Monday, Galaxy-type Space Shootout, Sopwith (Bi-plane dogfight simulation).
- M1083: BIBLE QUIZ. Trivia-type game with 1000 multiple-choice questions drawn from the Bible.

### UTILITIES

- M2016: MENU SYSTEMS. Create your own menus. Contains Sysmenu, Automenu and EZmenu.
- M2025+: DOS EXTENSIONS. Two disks of extensions for the command of Dos. Similar to your operating system, with more features. Eg, copy command accepts multiple statements on a line. £18.
- M2035: MORE HARD DISK UTILITIES. Super collection for optimising disk usage, undeleting, etc.
- M2048: PAL FOR SIDEKICK. Special enhancement for SK's appointments' calendar, plus an alarm clock.
- M2049: INTEGRATED UTILITY FOR PERSONAL MANAGEMENT. Like Sidekick, with calculator, notepad/editor, appointments calendar, address database, cut and paste, file management, etc.
- M2051: VIDEO/MONITOR UTILITIES. Special collection to extend control over cursor, set screen colour, blank screen, better scrolling, etc.
- M2061: HARD DISK UTILITIES (3). New collection. Super undelete, AT diagnostics, easy path find, hard disk directory, better backup utilities.
- M2062: MAGIC MENUS. Superior Dos front-end that lets you create your own menus. Full-screen edit; pop-up menus for directories, dos commands, calculations, printing, etc.

### WORD PROCESSING/ PRINTING

- M3003: MULTIFONT WRITER. Gives on-screen

## TOP QUALITY PUBLIC DOMAIN & USER SUPPORTED SOFTWARE

scientific notation, Greek letters, gothic, bold, italics, etc. Recommended.

M3007: SPELLING CHECKER. Our 1988 version has thousands of new words added, incl business/computer terms. Works with most word processors (not Amstrad version of Wordstar).

M3014: SIDEWRITER. Generates printed output sideways to fit wide reports onto a page.

M3020: EXCELLENT WORD PROCESSOR. Compatible with Wordstar. Has clear, easily followed commands on screen.

M3021: QUALITY MULTI-FONT PRINTING. on dot matrix, incl Courier, Greek, Helvetica, Palatino, Roman, Italics, etc.

M3025: TOUCH TYPING TUTOR - PRACTICE AND EVALUATION. Lets you read text from screen, use own text, reports speed/accuracy.

M3031: SCREEN GRAPHICS FOR WORD PROCESSING. Does fancy borders and lines for screens, tables, charts.

M3032: MERGE FOR WORD PROCESSING. Controls small database for names, addresses, etc, which it adds to form letters to personalise.

M3033: SUPER FOG INDEX. Examines your text for readability and complexity. Helps you judge whether your talk or article is suitable.

M3034: VERSATILE PRINTER SETUP. Printer controls can be configured for many printers, including IBM, Epson, Okidata, Gemini, NEC, Laserjet, which are preset.

M3035: PRINTER UTILITIES for Epson compatibles. Produces justified copy on dot matrix, has memory resident setup utilities, multiple font printing, etc.

M3036+: FULL-FEATURED WORD PROCESSOR WITH C SOURCE. Many features that you can use and routines that you can borrow, modify, learn from in your own programming. 3 disks. £24.

M3037: WORD PROCESSOR THAT INPUTS SPREADSHEET VALUES. Transfer figures from spreadsheet to include in reports. Will also update changes in value.

M3038: DESKTOP PUBLISHING. Word processor for high quality printing, multiple columns, extended ASCII (solid lines/borders, foreign characters), more/less lines per page, variable print size, merge files, etc.

**SHAREWARE REQUIRED FOR INTERNATIONAL DISTRIBUTION**  
We have extensive marketing and distribution facilities locally and overseas and require quality software for international distribution. Adequate documentation should be on the disk.  
Please forward submissions to our Chief Executive at the address below.

CP/M AND MACINTOSH  
Call or write for free catalogue.

**PUBLIC DOMAIN NEWSLETTER**  
For news, views, reviews and how to use public domain and user-supported software subscribe to our quarterly newsletter. Also includes updates to catalogue and monthly news-sheet on new releases (for MS-DOS). Only £12. (VAT not applicable.)

### GRAPHICS

M4001: SELECTED GRAPHICS. Some of the best programs, including a picture-graphics set of commercial standard.

M4002: SLIDE PRESENTATION. Prépare transparencies for overhead slides.

M4014+: COMPUTER-AIDED DESIGN. Dancad3d will do complex drawing, 2 or 3 dimensions, print sharp lines for mechanical drawing, illustrations, animate parts. We've squeezed 4 disks on to 2. £18.

M4019: FORM DESIGNER. Perhaps the best available for designing your forms layout. Suits invoices, order forms, letterheads.

M4026: 3D-GRAPHICS. Gives wire frame modelling; will move, tip, change scale, rotate.

M4027: CURVEFITTING FOR GRAPHING RAW DATA. Produces least squares fit on X,Y data. Curves for 25 equations.

### LANGUAGES

M9001: BASICA/GWBASIC COMPATIBLE INTERPRETER. Runs programs written in industry standard Basic.

M5026: MACRO-ASSEMBLER. If you didn't get one with your computer, this is one of the best.

M5033: TURBO PASCAL ROUTINES FOR HERCULES GRAPHICS. Now includes two CGA emulators (compiled) for running on Hercules Board many programs intended to run with Colour Graphics Board.

M5039: FLOW CHART DESIGNER. Puts flow of operations on screen for system or program design.

M5049: C WINDOWS AND SCREENS. Library of routines for C programmers.

### COMMUNICATIONS

M6014: SUPER NEW COMMUNICATIONS. Telex is powerful, yet easy to use, menu-driven. Contact bulletin boards.

M6017: MINIHOST BBS. Personal bulletin board for small business use.

M6018: MEMORY RESIDENT COMMUNICATIONS. Does file transfers in the background, freeing your computer for other tasks.

### CALCULATION/BUSINESS

M7001: GENERAL LEDGER ACCOUNTING. Has Gledger, Cash Book, Profit/Loss, Balance Sheet. Prints cheques. Data can be read by Lotus 123. Easy to use.

M7004: STOCK MARKET ANALYSIS (1). Special aids to help you "think and grow rich". For managing and evaluating portfolios and prospects. Needs Basic.

M7015: PROJECT MANAGEMENT. Handles 1000 tasks; does critical path analysis, cash flow, bar charts, cost reports. Needs Basic.

M7016: STOCK CHARTING SYSTEM. records highs, lows, volumes, moving averages for stock market prices and charts for you. Needs Basic.

M7023+: SINGLE ENTRY ACCOUNTING. Simple approach that handles general ledger, accounts receivable, accounts payable, inventory, payroll, depreciation. Two disks. £18.

M7031: PERSONAL FINANCE MANAGER. Manages cheque and credit card accounts, savings, purchases, withdrawals, interest, budgets.

M7041: MEMORY-RESIDENT SPREADSHEET. Full featured; at hand when you want it; insert calculations into text, etc.

### DATABASE

M8003+: FAMILY TREE/GENEALOGY. Recording, grouping, tracing, printing family tree. In Basic. Two disks. £18.

M8009+: SUPER DATABASE MANAGER. New version. 120 fields, 16 million records, fast sorting, fields anywhere on screen. Calculations. Two disks. £18.

M8012: LABEL PRINTING. Collection that allows you to print labels for all sorts of uses, as well as control mailing lists.

M8018+: DBASEIII COMPATIBLE DATABASE MANAGER. Bargain, with similar features to, DBASEIII and is compatible with files generated by it. 2 disks. £18.

M8025: MEMORY-RESIDENT DATA MANAGER. Manipulates small databases & lists, does editing, changes fields, sorts, splits, combines files. Up to 1000 records.

M8026: NETWORK DATABASE. Maintains filecard type entries in a local area network (LAN). Needs Dos 3.1 or later.

M8027: ON-LINE MANUAL FOR DBASE3 & CLIPPER. Call for pop-up help when you're stuck for correct syntax, etc.

M8028: DOCUMENTATION SYSTEM FOR DBASE2/3, CLIPPER, FOXBASE. Gives paths, program tree structure, lists files used, gives summary of variables, procedures, indexes, cross-references.

M8029: DBASE3 BUG FIXES AND HINTS. Special collection to assist with the anomalies and idiosyncrasies of Dbase.

### EDUCATION

M9001: GWBASIC/BASIC COMPATIBLE INTERPRETER. With tutorial. Suits compatibles.

M9003: MATHS TUTOR. Program in Basic that suits first six years of schooling.

M9004: PC-TUTOR. Learn more about the operation of your computer, the important commands, etc.

M9007: SECONDARY MATHS. Programs in Basic for trig / complex functions / logarithms / slopes / coordinates / line equations / determinates, etc.

M9014: MATHEMATICS LEARNING GAME. Fascinating way for primary children to learn their numbers and do elementary arithmetic.

M9018: EDUCATIONAL GAMES FOR PRE-SCHOOLERS. Fun with words, letters and numbers.

### GENERAL

M9518: PIZZA RECIPES. Collection of hints and recipes for cooking better and more varied pizzas.

M9519: LIFESTYLE AND HEALTH ANALYSIS (2). Reports health and heart risk appraisal for health professionals.

M9520: PROGRAMS FOR THE HANDICAPPED (2). Income and expense tracking for the blind. Needs voice emulation.

M9521: STRATEGIES AND PROBLEM SOLVING. Analyse, plan, understand and act on a specific issue you may face.

# SELTEC

## BEST OF THE BEST!!

### DISK OF THE MONTH SERIES— NEW RELEASES MONTHLY

Every month we examine hundreds of programs collected from our world-wide sources — from UK, USA, Canada, Europe, Australia and New Zealand — and select for release in our catalogue those we consider to be the most outstanding public domain and user-supported programs.

In our search we also discover some gems that stand out even in this select company; so each month we gather this special collection on to a single disk — a minimum of eight fully compiled programs — utilities, graphics, business, scientific, printing, wordprocessing, games, educational programs, etc. Most are completely new; in some cases it's a recent update of a classic program. These disks are released as part of a subscription series — the Best of the Best — at a price which is far less than if you bought the disks individually. And our subscription price INCLUDES taxes and postage/packing.

Our present Best of the Best series is for MS-DOS machines — the IBM-PC and close compatibles. 5¼" and 3½" disks are available.

#### SPECIAL BONUS OFFER!

If you subscribe now — in addition to the 12 disks of the Best of the Best Subscription Series — we will include a bonus disk of your choice that may be chosen from our advertisement on the facing page (single disks only — not sets, which have a plus sign as part of the catalogue number). Simply add the catalogue number to your subscription order. You will receive the bonus disk with your first subscription disk. See details on the coupon below.

#### MAIL AND TELEPHONE ORDERS:

SELTEC COMPUTER PRODUCTS LTD.,  
"Farley Hall", Wokingham Road,  
Bracknell, Berkshire RG12 5EU

**A non-communication situation...**

**...Simply solved by Beckman Industrial's New EasiBobs**

Our new breakout boxes make short work of tracing any communication problem, whether it's the right signal down the wrong pin or no signal at all. They're very competitive in price and extra easy to use.

With positive slide-type switches and large LEDs. Dual gender connectors to cut time looking for gender changes and patch cables.

Components chosen for their reliability.

And a high impact ABS case that takes field service abuse. There are five Beckman Industrial EasiBOBs, from a basic low-cost model providing unpowered monitoring to 15 lines, to a combined powered BOB and cable tester which monitors 25 lines. They are supported by a highly versatile patching system and cable changers. So sophisticated in technology, so easy in use.

For further information see the RS Components catalogue (computer product section) or contact Beckman Industrial.

### IBM XT/AT TO PS/2 SOFTWARE TRANSFER

*3 1/2" Internal upgrade for IBM PC's and Compatibles*

To read by the stream of press releases that come into the PCW editorial office, you'd think that making a PS/2-compatible machine required no more than taking an ordinary PC-compatible and fitting it with 3 1/2" disk drives.

To our rescue has come a wonderful product from Citadel — a £129 3 1/2" floppy disk drive in a 5 1/4" format chassis that slips into a spare drive slot on a PC and uses standard power and data cables.

Fitting the drive into my AT-compatible proved to be no problem. Getting the machine to format disks correctly proved more difficult. Although DOS said that there was 720k of available space on a newly-formatted disk placed in what I referred to as drive B: no other 3 1/2" disk drive would recognise the disk.

To the rescue came Citadel, who gave the following explanation:

When you format a disk under DOS, the program looks in the BIOS to see what format the disk should be. Even altering the CMOS set-up on an AT doesn't affect this process. The default for drive B: is 360k and this is what it happily does.

Using a program like PC Tools to format disks shows what is really going on as, for my newly-installed drive, it only gave 160k, 180k, 320k and 360k as possible capacities.

The trick is to use DRIVER.SYS which is supplied with DOS versions 3.2 onwards. This installs extra 'logical' drives whose parameters can be specified in your CONFIG.SYS file.

Inserting the line 'DEVICE=DRIVER.SYS/D:1' into my CONFIG.SYS produced a message at boot-up time to the effect that external drive E: had been installed. I then loaded up PC Tools and it informed me that drive E: can be formatted in just one way — to 720k. As long as I access the 3 1/2" drive as E: rather than B: I now have no problems with any DOS operation.

D. COHEN

(Reprinted from PCW December 1987)

**1,000 floppies hold a lot.**

**Exactly the same as 1 thin CD-ROM disk!**

The new memory storage medium CD-ROM can store 270,000 pages! That's as much as one thousand single-sided minifloppies. Since it's the same size as an ordinary music digital disk, the savings in space are enormous. And if you consider distribution and mailing costs for 1,000 pages, let alone two-hundred times that amount, it's clear that the CD-ROM's 552 Mbytes can dramatically cut costs.

Ideal for massive storage, CD-ROM data can't be destroyed by magnetic fields. Text, graphics, voice and music can be stored for new software applications. And the ideal drive for this new medium is definitely

Hitachi's CDR-1502S.

Hitachi's new custom LSI assures hard read error under  $10^{-12}$  without layered ECC.

And since the drive adopts the same proven electro-mechanical technology as our mass-produced audio CD players, you can be sure the CDR-1502S is bug-free from the beginning.

You can offer our drive for your product line either as a stand-alone unit or built-in. We will supply the 8-bit parallel interface card for DMA for most personal computers to make life easier.

And more profitable.

- ★80287 Co Proc Socket
- ★8 Expansion Slots
- ★12.5/8 MHz speeds: software/hardware switched
- ★Mono or Colour Graphics Adaptor
- ★1 x 1.2Mb floppy
- ★1 x 20 or 40Mb winchester
- ★One parallel/One Serial (+1 optional) ports
- ★Real Time Clock/Calendar with battery
- ★101 Key enhanced Keyboard
- ★200 watt power supply
- ★12" Hi Res Green Screen Monitor
- ★MS DOS 3.21 & GW BASIC
- ★Genius GM6+ Mouse with software

#### What is Dynamic Speed Switching (DSS)

A system operating in Turbo mode will also interface with all add-on cards at turbo speed. Most of the add-on cards are designed for standard speed. This creates a clock conflict and occasional unexplained parity errors. DSS avoids this problem by slowing down the clock automatically to standard speed whenever interfacing with the add-on cards allowing use of all standard cards.

### Hi-Mem Super Speed XT Systems

- ★ V-20 CPU
- ★ 10/4.77 MHz Dual Clock Speed
- ★ 704K of RAM
- ★ Dynamic Speed Switching

#### SPECIFICATIONS

- ★V20-CPU
- ★704K RAM
- ★8087 Co Proc Socket
- ★8 Expansion slots
- ★10/4.77 MHz speeds: software/hardware switchable
- ★1 x 360K floppy
- ★1 x 20Mb winchester
- ★1 parallel/1 serial (+1 optional) ports
- ★Real Time Clock/Calendar with battery
- ★84 Key keyboard
- ★150 watt power supply
- ★12" Hi Res Green Screen Monitor
- ★MS DOS 3.21 & GW BASIC
- ★Genius GM6+ Mouse + software

Specification as above £799

Meta Dyne Hi-Mem 10MHz 704K PC  
PC Dual Floppy System £629  
Carriage/System £16

Alternative configurations on request

#### Basis for spec & price comparison

1. Every system claims to be fast, however: is the system CPU rated for the fast speed or has the cheaper option of using only the higher frequency crystal to speed up the clock been used. Faster cpu's cost considerably more.

2. Specifying large RAM capacity sounds good but how much RAM is actually installed. RAM cost is high and how much would it cost to achieve the full capacity. Is the RAM speed compatible with the Turbo speed. Slower RAMs cost a lot less.

3. Finally a point in our favour - is the system capable of Dynamic switching or would you accept a possibility of occasional parity error.

All systems carry a full 12 month return to base warranty.

Nationwide on-site maintenance contracts available.

## GENIUS MOUSE GM6 Plus

*Introduces a new dimension at your fingertips  
 One Mouse for all your applications software  
 Extensive software included.*

*Fully compatible with Microsoft Mouse and Mouse System Mouse.*

Genius mouse with solid state electronics and optical technology offers most reliability, accuracy and precision. Programmable resolution (22 to 200 dpi or 0.12 to 1.08mm dot) allows you to set the cursor movement to suit your personal requirement.

Genius menu maker allows you to link the mouse with any application software with pop up menus. Use of pop up menus at every stage of operation improves the productivity considerably and the menu maker lets you create these with ease and flexibility to suit your style. Over 20 pre configured menus for some of the popular packages are included in the menu library. These menus can be edited as required.

Dr Halo III, the professional graphics and slide show software included with GM6 plus allows you to create sophisticated graphics and then merge them into a slide presentation. Features include: 256 colour type, cut, copy and store, multiple choice fonts, CGA, EGA, Hercules, PGA and VGA displays, large selection of printer and plotter drivers, true colour or grey scales, move or cut irregular shapes non destructively, mix your own colours and virtual page in all modes and many others.

In addition to above GM6 plus is supplied with a high quality attractive mouse pad and a fixed mouse pocket to store the mouse when not in use.

**GM6 plus for only £69(b)**

## LOCAL AREA NETWORK

# DIGITASK

## AXIOM PERSONAL COMPUTERS

 Digitask have been producing PC compatibles and supplying computer hardware for over four years, to end users, corporates and dealers. Our customers include some of the biggest names in the business and almost every university and technical college in the land.

These customers demand the most exacting specification for their computer systems and this is achieved by evaluating hundreds of possible component products. Most don't pass the test. We even turn away products that our competitors choose. Built and tested in the UK and containing only "industry standard" components from specialist suppliers, each a market leader in their own field, we provide some of the most reliable PC compatible systems currently available. Why save a few pounds on an inferior computer? If you want reliability then choose Digitask.

We are a wholly owned British company totally committed to the PC market, with an exceptional reputation for service and support over the past four years. How many of our competitors can say the same?

Maybe that is why over 12000 computer users have chosen Digitask.

- Intel 8088 processor running at 4.77 MHz or 10 MHz
- Software or hardware switchable
- Award BIOS
- Provision for 8087 co-processor
- Full 640 KB memory
- Choice of either TTL hi-res mono monitor and mono card or composite mono monitor and CGA card
- Single floppy disk drive 360k (Toshiba)
- 8 IBM compatible expansion slots on desktops
- 1 x Parallel port, 1 x Serial port (2nd Serial Opt.)
- Clock, games port and light pen interface

#### INCLUDES:

Free Application/Utilities software

## AXIOM AT range

### STANDARD FEATURES

- Intel 80286 processor running at 6 MHz or 12 MHz
- Software or hardware switchable
- Provision for 80287 co-processor
- Award BIOS
- Full 1 MB of memory
- Choice of either TTL hi-res mono monitor and mono card or composite mono monitor and CGA card
- Single floppy disk drive 1.2 MB (Toshiba)
- 6-16 bit IBM compatible expansion slots on desktops
- 2-8 bit expansion slots
- 2 x Parallel port, 1 x Serial port (2nd Serial Opt.)
- Clock, games port and light pen interface

INCLUDES: Hard disk/Floppy disk controller, Free Application/Utilities software

Whether you choose the Digitask Axiom XT (8088) or the Axiom AT (80286) range of computers, you will have the choice of three very attractive, but different styles of cases.

#### Desktop:

The popular desktop system incorporates a small footprint case with an easy access flip-top lid, and comes complete with monitor and 101 key expanded keyboard.

#### Portable:

The portable range offer compactness with the inbuilt 9" amber monitor and keyboard. Room for three half-height disk/tape devices and seven IBM compatible expansion slots. Facility to connect external monitors.

#### Mini Portable:

The new range of mini portable systems provide a backlit LCD display, which can be selected as normal or inverse video. This superb machine can accommodate two half-height disk/ devices and five IBM compatible expansion slots. Facility to connect external monitor.

All of the Digitask range of computers come complete with free Application/Utilities Software and a full one year parts and labour warranty. National on site maintenance is available.

## DIGITASK

**£179**

- Allows free interchange between XT® and AT® computers
- Dual drive controller and Brand Name 80TR, 1.2MB formatted drive
- Achieves more than 3-times capacity of normal 360KB floppy drive
- Controller handles (intelligently with on-board ROM) combinations of 1.2MB and 360KB floppies
- FAST data transfer (500K Bits/sec) in 1.2MB format. Excellent for Winchester backup
- 1.2MB drive reads/writes and formats 360KB using normal DOS 3-X commands
- No messy DOS patch software necessary!
- Standard DIGITASK ONE YEAR parts and labour warranty

## ABOVE FUNCTION CARD

**£179**

- Up to 2MB expansion memory (2048KB)
- First 384KB may be configured as conventional memory
- LIM, LOTUS®, INTEL®, MICROSOFT®, (EMM) specification
- Async Comms adaptor (configurable as COM1 or COM2 or disable)
- Parallel Printer Port (configurable as LPT1 or LPT2 and Hercules® compatible)
- Real time clock/calendar with battery backup
- Games adaptor
- Utility software includes expanded memory manager, clock, ramdisk and printspooler
- Includes cables
- Fully compatible with IBM® PC/XT/AT computers
- Standard DIGITASK ONE YEAR parts and labour warranty
- (Unpopulated) Ram at £99/megabyte

# NEW EGA: IBM SYSTEM/2 vs. EVA/480

**ZOOM** (magnify) your drawings 100 times faster  
**PAN** (move) the drawings freely, instantaneously

## EVA<sup>®</sup>/480

### THE NEW GENERATION EGA

132-column for spreadsheet, word processing, IBM/DEC terminal emulation

640 x 480 Graphics

**ZOOM YOUR GRAPHICS  
IN 0.1 SECOND  
PAN IT HEAD TO TAIL  
INSTANTANEOUSLY**

smooth scroll in hardware window

#### Hardware Zoom, Pan, Window

The EVA/480 brings all these features to your fingertips. Instantly zoom any part of the display, create a window and pan in all directions. Now you can have professional graphics features at EGA prices, only from EVA/480.

#### Hercules, CGA, EGA, PGA 640 x 480 and even a printer port

The EVA/480 provides 100% complete compatibility with all the above display standards and is the first EGA (640 x 350) compatible card to offer 640 x 480 graphics. All modes can be selected by hardware, software or from the keyboard. Complete with printer port the EVA/480 provides what IBM forgot.

#### 640 x 480 Graphics

The EVA/480 includes extensive 640 x 480 software drivers: M/S Windows, AutoCad, Page Maker, Lotus 1-2-3, Symphony and the full Dr. Halo II package is included. Drivers are also available for Ventura Publishing, EGA Paintbrush, Prodesign, Drafix, MathCad, FastCad and a growing list of popular software packages. Remember, you will need a MultiSync or equivalent monitor, to display 640 x 480.

#### 132 column Text

The EVA/480 can produce text in 132 column x 25/28/44 lines in EGA mode, supporting Lotus 1-2-3, Symphony, Word Perfect, Wordstar, IBM/DEC terminal emulation

supported by DCA (IRMA), CXI, Persoft (SmarTerm), AST. Alternatively, try the 80 columns x 60 lines.

#### Performance and Quality

The EVA/480 is manufactured by Tseng International Inc. and is rated the No. 1 EGA card in the USA by PC Tech Journal (Nov 1986). They quote "All of the boards (Paradise's Autoswitch, Video 7's Vega...) presented here perform adequately for EGA functions, one clearly outshines the others; Tseng's EVA." EVA/480 is PC/XT/AT compatible and is also suitable for 16MHz 80386 systems. Ideally suited for use with the NEC MultiSync and other multi-frequency monitors. As quoted by NEC HOME ELECTRONICS, "The best for meeting the design philosophy of the NEC MultiSync monitor." Tseng's EVA/480; the new generation EGA card you can trust.

#### Technological Excellence

The EVA/480 is developed by Tseng Labs. Inc, a US public company since 1984. Tseng Labs design the VLSI chips, adaptor, BIOS and utilities of EVA/480. Tseng Labs are the leaders in EGA technology and as such are a manufacturer dedicated to graphics excellence.

#### Availability

The EVA/480 is distributed in the UK by Digitask Business Systems Limited. Call us now for further information.

EVA is a registered trademark of Tseng Laboratories, Inc.  
MultiSync is a registered trademark of NEC Home Electronics (USA) Inc.  
IBM and SYSTEM/2 are registered trademarks of International Business Machines Corp.

The Recommended Retail Price for the EVA/480 is £229.00. Educational and Dealer enquiries welcomed.

### MARKET ANALYSIS

Total Market Share

The problem of calculating an acceptable figure for the total size of the office furniture market can be summarized as follows:

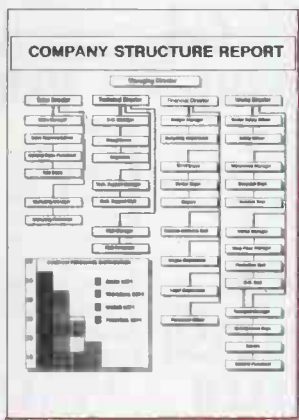

The fragmented nature of the poorly researched area, together with a number of estimates which vary according to opinion.

Reconciliation

Screen Based

10% 20% 30% 40%

### NEWSLETTER

#### NEW SEASONAL SALES DRIVE

Research from our region indicates a good level of optimism for the new season, with sales expected to rise by 10% over the last year.

#### NEW LOOK COMPANY IMAGE

Following a programme of restructuring, the company has introduced a new look image, with a new logo and branding.

NEWSLETTERS

Imagine being able to create professional quality documents, from the smallest letter to the largest presentation - in house! Now it's all possible with the new Finesse range of Desktop Publishing software. Utilising dynamic WYSIWYG facilities (What You See Is What You Get), Finesse puts you right at the heart of the Desktop Publishing revolution. Coming complete with a superb selection of typestyles in a wide choice of sizes, on-screen graphics and a preview facility, Finesse makes it simple to create professional designer results - quickly and economically. Text can be imported from files created using a wide range of word-processors such as Wordstar, Word Perfect and 1st Word Plus or any ASCII text, and edited from within Finesse to achieve that final result. Graphics can be imported from Gem Paint/Draw/Chart and numerous scanners and then pasted, cropped and re-sized to fit any layout.

Finesse produces outstanding results and although it is at its very best when output to a Hewlett-Packard compatible or Postscript laser printer, fantastic results can be achieved using any normal 9-pin Epson or compatible dot matrix printer.

Finesse is available for your Amstrad PC, IBM-PC and 100% compatibles. Finesse comes as a complete package and is available with a Microsoft compatible serial mouse for only £159.99 or without for £99.99 and is available from all good computer dealers or direct by cheque, Access or Visa. All prices include VAT and post and packaging. To place your order or for further software information dial the number below.

Why are Dun & Bradstreet and other Fortune 500 companies turning to

# Le Menu

for hard disk management?

"Of the 11 menu programs evaluated, Le Menu provides the features we desire, including: Front Line Security, Time Usage Tracking, Project Management, and succeeds in the formidable task of making DOS very 'User Friendly'." Steve Dashesky, Dun & Bradstreet

"The time Le Menu saved and the errors it prevented paid dividends many times over its modest cost in the first week." Mike Smith, Office of Administrator for the Courts - State of Washington

"Le Menu is easily the best of the 15 menu programs we've evaluated for the PC. We highly recommend this product to anyone." Office of the Solicitor General of Canada - Toronto, Canada

The reason so many major corporations, government agencies, and small businesses are turning to Le Menu, speaks for itself. Networking - Security - Time Usage Tracking - Context Sensitive Help - Ease of Use  
**Le Menu - The Most Powerful Hard Disk Organizer!**

### 4 POWERFUL VERSIONS

## CAN CAN CAN-CAN COMPUTERS

Can Can Computers (Franchising) Ltd., Can Can House, Station Approach,  
Trent Valley Road, Lichfield, Staffordshire WS13 6HE. Tel: (0543) 262090/257008

### ME! RUN MY OWN BUSINESS? SURE YOU CAN!

We will set you up in your own business with the potential to make you a "high earner".

You will join a successful group that combines our knowledge of marketing, buying, vertical market software, business development and your entrepreneurial skills selling unique computer based solutions.

Can Can Computers (Franchising) Limited offer you the chance to be trained and set up in your own business, supplying a complete range of business computer hardware, plus a range of unique software. This is definitely not a dealership. We will contribute a professional image, national advertising, acquisition of Vertical Market Software exclusively for the Group and buying power affording favourable discounts. You will contribute a presence in your local area fulfilling its needs and demands.

An investment of £10,000 is all that is needed to get your own business that is up and running from day one. This, our second year will be one of growth and continued success. **Join us now!**

For prospectus contact ABI on 0543 262090, or write to Can Can Computers (Franchising) Limited, Can Can House, Trent Valley Road, Lichfield, Staffordshire WS13 6HE.

Or see us at the following venues:

25th February, LEEDS area,  
Ladbroke Hotel, Ainley Kop  
Huddersfield. Tel: 0422 75431

3rd March, MANCHESTER area,  
Ladbroke Hotel, Manchester Airport. Tel: 061 436 4404

17th March NEWCASTLE area,  
Holiday Inn, Newcastle. Tel: 091 236 5432

## CASHFLOW PLANNING? FINANCIAL BUDGETING FOR GROWTH

Then you need **CASHFLOW FORECASTER!**  
for AMSTRAD PC, IBM PC or compatible,  
APRICOT COMPUTERS

**CASHFLOW FORECASTER specifications:**

- ★ A cashflow forecast based on bank's format plus Profit & Loss and Balance Sheet essential for loan applications.
- ★ An efficient credit forecast to improve your cashflow.
- ★ A detailed analysis of your trading expenditures.
- ★ A comprehensive list of financial ratios giving you a wealth of information on the health of your firm.
- ★ A highly user friendly design so your only task is to enter data to well laid out calculation sheets.
- ★ An easy to use turnkey system so you can get CASHFLOW FORECASTER working in no time at all.
- ★ A high performance software package written in the C language for single or double disk drive systems.

**The MANUAL specifications:**

- ★ Business finances simply explained.
- ★ Strategies for credit forecasts and bank overdraft.
- ★ Multi-period financial forecasting.
- ★ How to determine forecast accuracy.
- ★ In addition to all these, a step by step manual enables you to start cashflow forecasting without previous experience.

**IMPROVE YOUR BUSINESS FINANCE WITH  
CASHFLOW FORECASTER FOR ONLY £59.95**

Order with cheque for £59.95 + VAT + p&p £1. (£69.94)  
direct from MayGee Systems or send SAE for details. Please  
specify computer type. Allow 10 days for delivery.

# Time out for sloppy assistance

Those of you living in the London area will be able to get a genuine, independent look at the local computer dealer population when *Time Out* publishes its next guide to shopping in London. I was asked to produce a recommended list of shops for this guide.

The news isn't exactly encouraging. I can best sum it up with the following riddle: What's the difference between a used car dealer and a computer salesman? Answer: The used car dealer knows when he's lying.

I've often been amused and appalled by the standard of 'service' to be obtained across the counter of the typical computer store. I've had occasion to repeat some of the sillier tales in this column, but I had never realised just how typical these anecdotes really are.

On this occasion, the editor of the guide suggested that we visit each store individually, and mark them out of ten. I added up the cost of doing so, and the accountants at the guide suggested an alternative — put a member of *Time Out's* staff on the job.

This was a brainwave, because we found a reporter who knew nothing — literally — about computers, who was able to keep a straight face when his questions were answered, simply because he had no idea how funny the answers were.

Buy the guide if you can, by all means, for a laugh if nothing else. It ranges from the unbelievable 'You'll have to make an appointment with one of our directors' to the ridiculous 'Copying software from Commodore tape to disk? You'll need a disk costing £800, or we could do it for you, for a price . . .'

I do know one or two stores where the staff know what they are selling, why you should buy it, and what else you might consider. By far my favourites are Pilot Software and Personal Computers, both in London, where I know the people who run the stores, and go to them for advice and help when stuck. Pilot is best known for its games floor, but it does have a business computing department downstairs in its Rathbone Place premises, where database software is written and business systems are supplied.

The only reason I get annoyed about the inadequacies of computer stores is the irritating way they have (many of them) of justifying high prices by talking about how wonderful is the service they provide.

My experience is that they either provide a service as an extra, at a price (and not a low one, either — a £200 fee for a two-day training course is keen!) or they don't provide much of a service at all.

In fact, I seriously doubt that this will ever change.

When one takes a far less complex beast like a motor car and visits a sales garage, one knows that the over-dressed idiot who will collect commission on the car you're going to buy is someone knowing nothing — and caring less — about the internal details of the vehicle. When the time comes to get the thing fixed, one talks to a mechanic. Strangely, the more different sorts of cars the mechanics know about, the lower their fees.

Expecting a Ford mechanic to fix a Ferrari is, however, a

much more sensible attitude than expecting an IBM sales executive to know what is going on with the screen of a Macintosh, or an Amiga seller to understand the Atari ST. So one shouldn't get upset when they turn out to 'know' things that aren't true.

But I *do* get upset. If stores really did use their profits to pay better-qualified staff reasonable wages when they learned their trade, those staff would stay on board and help expand the business. Instead, more dealers pinch pennies to feed their own image of themselves and the standard of living they think they deserve. This approach to business is what killed off the British corner store until the Indian shopkeepers took over and turned it back into the goldmine that it once was.

You can't become rich from a computer store — or anything else — until you have built it up. Until our store-keepers understand this, we buyers will have to make sure we know exactly what we want, what it will do, and just need someone to hand it over.

Just when you thought your PC with its NEC Multisynch colour EGA screen was fit to show to the neighbours, NEC appears with the Multisynch GS. You can't go one better than this — it shows colour graphics in black and white.

It's incredibly high-resolution. It is supposed to work not only at ordinary monochrome standards, but also at Hercules, CGA and EGA, as well as the new IBM MCGA and VGA standards. It will show colour displays in up to 65 different shades of grey. And it costs only £200.

Of course, if you really *must* have colour, there's still the Multisynch. Except it's now joined by the Multisynch Plus. Only 1024x768 pixels. A trivial £930.

## IBM approves Dixons as dealers

You can now buy an IBM machine from Dixons. Admittedly, not just any Dixons branch, but the chain does have six (at the last count) stores fully-approved to sell the PS/2 Model 30.

This has caused no end of irritation among other computer dealers, who had been told that this was the first step in a relaxation of the rules about who can sell IBM hardware.

The plan was originally sold to IBM's distributors as a way of appointing more distributors who would, in turn, 'carry the can' of servicing dealers. And they would appoint new dealers themselves.

As finally announced, however, the only rule that has been relaxed is financial. To qualify as a dealer's agent, a computer store has to pass every single test that an IBM Approved dealer has to pass — bar one. It has to have the level of staff, the shop front, the square footage and all. But it doesn't have to pass the same financial stability tests.

I have to say that I wonder what the point of the change might be. The distributors are very, very annoyed. At least one of the eight names who are selling IBM computers to dealers has already been contacting non-approved dealers and saying: 'You can now apply for approval by us, without going through IBM.' IBM will say they jumped to conclusions.

In passing, you have to be amazed at Dixons' decision to sell the Model 30 — unless, that is, you think it is a machine worth buying.

The Model 30 is not really a PS/2 family machine, but an 8086-based box with 3½in disks. It has many similarities to Apricot's now-defunct PC, with the sole advantage of being much more compatible with PC-DOS software and being able to run MGA graphics.

In New York, all the advertisements for the machine offer it at \$1086 (around £600) including two disks, a screen and a keyboard. Dixons has promised that 'as usual, Dixons' prices will be highly competitive, and will start at around £2000 for a package comprising the twin-diskette computer, printer, software and on-site servicing.

That software had better be amazing software.

# Making silk purses from sows' ears

The arrival of a single plug-in card with an Intel 80386 chip in it has transformed a heap of junk in the back of a store into the most sought-after piece of hardware around. Total cost? £800 plus VAT, plus whatever value you put on your old PC.

The 'piece of junk' is the original IBM PC, now celebrating its fifth birthday in the UK. (It's older than that in the US, of course.)

The card is the Intel-produced Inboard 386, which fits inside the original PC and replaces the slow, old 8088 chip. The effect is astonishing, and not just in speed terms.

The bad news is that it's only speed you get. The card doesn't (yet) have available a version of OS/2 that will work on it, nor yet a version of Windows 386. Intel hopes to have these available after May. 'We're working on it,' the company promised.

In speed terms, the old PC is one of the least impressive machines on the market. With the 386 brain transplant, a rough workload Benchmark put it ahead of a 12MHz Dell 286 — even using the disk, which rather surprised me until I noticed that I'd been using an ultra-fast Priam RLL drive.

What really surprised me, however, was how the machine appeared to its owner, a computer dealer. I rang him up to borrow it for the test. 'Have you got an old PC, genuine original?' I asked. 'Oh, yes,' he replied vaguely, 'one or two that don't work properly and we can't bother to have fixed. I'm afraid it's useless. It's one of the original PCs, you know, with 16k on the motherboard, and a cassette port, and only five slots.'

It turned out that the 'fault' was a colour monitor set to conflict with a monochrome monitor, and removal of the mono card fixed that.

The machine actually requires you take out the 8088 chip. A short cable connects the board into the old chip slot, which means it will only fit into machines where the chip is in exactly the same place relative to the slots — the IBM PC and XT, the original Compaq and the Tandy 1200, apparently. You can't change the cable because its length is crucial to the timing of the signals.

After running my tests, I showed the machine to its owner. His eyes widened

progressively during the demo of how easy it was to fit; and, at the end, he suddenly found that he wanted it back, 'just to try out one or two things. Oh, and could I borrow the Intel board for a week?'

He has one problem: shortage of slots. With the Inboard in one, a floppy disk drive and a display card, there is no room for things like a clock if you want a serial port and a hard disk — unless you buy multi-function cards.

Most multi-function cards for the PC include added memory. The Intel Inboard includes 1Mbyte of its own, fast 32-bit memory, and it ignores all the PC's own memory entirely.

So, a new multi-function card has to be provided. My friend was last seen on the

track of an IdeAssociates card which does both floppy and hard disks, plus display and printer port.

Price turned out to be an issue. The card sells for \$999 in the States, so you can imagine my amusement to be told that it would cost £999 in the UK.

Both Intel and First Software, the importer, blamed each other for this discrepancy. A couple of hours later, they rang to announce a 'reduction' to £799 plus VAT. My tactful observation that \$999 equalled around £550 at today's rates seemed unwelcome.

Still, even at that price, I suspect a lot of 'defunct' PCs may suddenly be pulled out of cupboards. It does make for a fast machine.

**I will believe in these tower systems which are so convenient (because they save space on your desk) when the manufacturers notice that you have to crawl on the floor on your hands and knees to plug peripherals in and out.**

**This is Jarogate's latest 386-based box, and the interesting thing to this company is the fact that it is fault-tolerant. It actually keeps a log of every key that is pressed at any terminal, it has two disks which duplicate all disk operations, and it has an uninterruptible power supply.**

**What I noticed, at once, was the fact that I'd have to unplug every cable in every socket before I could pull the thing out as shown, and stick a new card in. OK, it's nice to have that little foot sticking out so that it doesn't fall over, but I'll be really impressed when the slots are put in back to front so I can reach them from where I sit.**

**This box, by the way, is for eight users. It costs a cool £22,000 plus. No, I didn't think you'd want the phone number.**

## Arthur sheds its nappies

Acorn is reported to have 'finally finished Arthur', the operating system for home users of its Archimedes super-micro.

To support this achievement, more applications software is starting to appear.

Most eye-catching of the last batch: a podule for the machine called Chromalock, from WildVision. This is described as 'a low-cost genlock and full-colour video overlay system which allows the spectacular graphics of the Archimedes to be superimposed onto a video picture.'

Details from 6 Jesmond Road, Newcastle-upon-Tyne NE2 4PQ. ▶

---

‘Unbeatable...’  
‘A considerable  
bargain...’

(Don't you believe it!)

---

When reviewers use words like 'bargain' and 'unbeatable' about your computers, you could just rest on your laurels.

At Dell, we accept quotes like those opposite as a challenge. (They come from reviews of the 286<sup>12</sup> and 386<sup>16</sup> in 'Personal Computer World', July '87 and 'Which Computer', October '87.)

So we're pleased to announce that we've actually improved on the specification of the 286<sup>12</sup>. Our new System 200 offers even better value in 12MHz computing.

And we're equally delighted to tell you that our 386<sup>16</sup> is renamed the Dell System 300 - and is down in price. With its new VGA and 3 1/2" drive options, it now represents yet more value in speed and power computing.

## The new System 200

The new Dell System 200 surpasses the performance of the Dell 286<sup>12</sup> - and costs less.

We have taken your needs into account when designing it. We've combined the highest standards of AT architecture with the very latest technological developments to give you OS/2 compatibility, 3 1/2" disk support, and VGA monitors. Plus it's simple and inexpensive to upgrade memory on the motherboard to 4-6MB.

Higher speeds and all-round performance make the System 200 the finest available 286 technology. Add to all that an incredibly low price and the inclusive package of direct service and support from Dell, and we've clearly beaten the 'unbeatable'.

## The System 300

Innovative design allows the Dell System 300 to maximise the performance of its 16MHz 80386 microprocessor. So if your applications require both power and speed this is the machine for you.

It will actually deliver advanced computing power more usually associated with

minicomputers. And because thousands of American users have found this to be the case, we've been able to reduce its price by £400 in this country. Making it an even more cost-effective alternative to the mini... and a yet more 'considerable bargain'.

## How a direct relationship benefits you

These changes reflect Dell's philosophy of dealing direct... to give you precisely the computer you need for a price you want to pay. Our machines are designed and built in Texas and configured for your needs in the UK.

And as the manufacturer we're proud to accept responsibility for them. We cut out the middleman and his margin - so bringing prices down - but we also provide better support than a dealer could.

When you buy Dell you not only get fast, powerful and compatible pc's but you get as much technical support as you want. And it won't cost you a penny.

Read the guarantee panel below and bear in mind that this support comes from the people who design and build the machines.

Our direct approach has proved popular with the end user. After just three years, we are one of the seven largest manufacturers in the USA. In less than a year in Britain, companies of the calibre of BP Oil International are already standardising with Dell.

## Order your Dell computer now

If you'd like to take advantage of an even better Dell package, get in touch today. Write to us at Dell Computer Corporation, FREEPOST (RG 1462), Bracknell, Berkshire RG12 1BR. Better still, 'phone us to discuss your computer needs in detail with our expert staff on

	with	70MB, 28MS hard drive	<b>£3,699</b>
	with	150MB, 16MS hard drive	<b>£4,399</b>

## Total Satisfaction Guarantee

**12** months' free on-site service - a Honeywell Bull engineer will visit the next business day. On site service covering all parts and labour can be extended up to five years at very reasonable rates.

**F**ree Telephone Technical Support to offer help, information and advice. Customers can ring our 0800 Hotline number and speak direct to Dell's technical experts.

**1** year limited warranty covering parts and labour.

**30**-day money-back guarantee. If you're in any way dissatisfied with your Dell computer you can return it within 30 days and we'll return your money in full.

DELL COMPUTER CORPORATION, COOKHAM ROAD, BRACKNELL, BERKSHIRE RG12 1RD. TEL.: 0544 860456.

Prices do not include VAT. Microsoft is a registered trade mark. All system prices and specifications are subject to change without notice. All orders are subject to Dell's standard terms and conditions of sale which are available on request.

# Amstrad's Organiser will travel for Triangle

Amstrad has decided to give away, free with its PPC portable, a piece of general-purpose travelling software called PPC Organiser. After some time struggling with it, I produced the following:

*DLe000001E-GGf) Peter Mackeonis Founder Triangle Publishing, Fictitious Street, London ERR3 9AM. 17 January 1988*

Dear Peter,

This is a pretty strange user interface. It works, but it is totally unlike anything else I've ever used. Is it seriously possible that one can use it without the manual?

For a start, I do expect the 'menu' to show all possible options. In fact, the manual always seems to know more — two or three (not trivial, but crucial) — operations which are available through hitting functions keys, such as function key F12 doing the dialling of a modem.

Putting the Help onscreen is a good idea. I'm less certain about the wisdom of putting it underneath the window I'm working on. Oh, I realise it comes up if you press 'Help', but when the Help screen is already on show (partially obscured, yes, but on show) one feels instinctively that one *shouldn't* press Help.

Similarly, having twelve function keys is a great idea, but showing only ten of them on the menu bar is less obviously wonderful. Also, the Help screen, which pops up all by itself if you seem to be stuck, appears to have the wrong information on it occasionally. Correct me if I'm wrong, but was this version put together in something of a hurry for the Amstrad launch at the Which Computer? Show, perhaps?

Some of the controls are weird. I mean, take the 'Editor Setup' menu. How do I get to it? Why, naturally, press the 'Insert' button. Obvious. There I am, typing away, and the Help screen says that function key F2 will flip the window, and INS is Underline-Bold and so on. In fact, to get the Editor Setup menu, you press the Insert button! And function key F7 is Variable insert . . . 000001. Well, that's the cardnum variable (whatever that is).

The idea of reading data in from the database cards is

nice, except you seem to have to remember what you called the cards. I know you can call up the database separately, but by that stage I had such a confused chain of commands and escapes and cancellations, that I had a template which included three other templates. All I could do was save it (it wouldn't let me abandon it).

The problem, I suppose, is that this is really a mail-merge operation — *never* simple. But I do think it could be more intuitive than it seems to be at the moment.

And the 'ESCAPE' key . . . well, I have to admit that I've always thought of that as an *escape* key, for when you had made a mistake and wanted to cancel what you'd done. Your program uses it as a sort of 'OK, go ahead' button.

The program includes a calculator, a card index, and a text editor which produces the funny non-standard control codes which you see at the top of this document. Well, some of them. There were lots of

others, which made it difficult to edit documents with WordStar and totally impossible to edit them with WordPerfect.

Not that it's easy to find these documents, as the system gives them arbitrary names. Letters are all named with a number, starting with LE and ending in .DOC.

Memos are all named with a similar number, starting with ME and ending in .DOC.

I found that if you'd been interrupted in a letter, the thing was pretty hard to find as a result. You had to abandon hope and start again. It then warns you: 'This letter already exists!' and dumps you back into it.

My judgement: a nice concept, very clever of you to make it 'pop-up' software, and it will succeed. That is, it will make the portable look like a better deal. At £60 for the Organiser, however, I think I'll recommend my readers not to get too involved with this software until it has been

around for a while and had the corners knocked off it.

You will forgive me, I know, but I have to say that most of Alan Sugar's users will end up paying money for something like WordPerfect Executive which includes a spreadsheet and word processing, and which, of course, Sugar was hoping to be able to wrap up in the bundle instead of this.

Oh, yes, I know you will forgive me. Simply, the bundle with the Amstrad will sell thousands of copies of the Organiser. After all, you have copy-protected it in a sense, because only Amstrad users will be able to run the Amstrad version. The rest of the world will have to buy the normal version.

And, if Amstrad's name could sell a dung-stuffed turkey like WordStar 1512, it will certainly make your Triangle Publishing company famous. By which time, I hope that this early version will be forgotten and superseded, a sensible upgrade policy will have been offered to victims, and you and your partners will be wealthy.

*Yours sincerely,  
Guy Kewney*

**Succinctly, Ambitron describes this beast as follows: 'Its mother was a plotter, its father a graphics terminal.' What you are looking at is liquid crystal 'light valve imaging technology.'**

**You would use it with the sort of software that writes to screen in colour, on the occasions when you wanted to see the complete picture of a CAD output. It can display (Ambitron assures me) 16 million colours at very high resolutions on a 22in x 34in screen.**

**Details on (0635) 36555 at 13 The Paddock, Hambridge Road, Newbury, Berks RG15 5TO.**

## Making a good thing better

One of the best utility programs for the PC, PC Tools, has just been made even better. Central Point Software, the US publisher, has released a new version called PC Tools Deluxe. Existing features include hard-disk backup, disk optimisation, protection against accidental hard-disk formatting, rebuilding damaged data, easy disk and file management (including undeleting), and so on.

The new version also includes: a new format program which can be recovered from and UNformatted if you make a mistake; a disk cache program for increasing speed; and a flexible file editor that can be used memory-resident and which will edit *any* kind of file. On top of all this, all the old functions have been speeded up and improved.

I find PC Tools Deluxe invaluable for all sorts of filing functions. It is far easier to use and more reliable than Norton's Utilities, which is its only close competitor.

PC Tools Deluxe costs £69.95 and is available from Evesham Micros on (0386) 765500.

## Toasting the winning car with . . . pasta?

Super Sprint was already the favourite multi-player arcade game in the PCW office, when I discovered that it is also a very good way of making toasted pasta.

The original game can be seen in any arcade, but since half my readers are too respectable to go into games arcades and the other half are too young, the game is easily described. There is a race track, and you have to get around it by steering a little image of a car.

PCW's editorial assistant, Chris Cain, assures me that the game is better with steering wheels (as in the arcade) than with joysticks. On the other hand, at 17, he's relatively old. Eleven-year-olds kids tell me that the arcade game is out of date and not nearly as good as the Electric Dreams re-creation. They also beat me.

It's addictive, and the reason it makes good toasted pasta is that you get very excited when you beat the computer car.

In each race there is a different track, with different bends, hazards, jumps and the like. Two players on an Atari ST can have a joystick each; one player can use the keyboard, and the computer plays too. If the computer car gets home before you, you're out and have to restart. But if you beat the computer, then Wow! You keep your points, and you can soup up your car.

The computer doesn't drive very fast, so you can beat it quite easily. As you would expect, the computer gets around this by cheating. For example, after the first few tracks, the computer starts introducing patches of mud, oil slicks and gusts of wind into the game.

Drive into an oil patch, and your car will go into a random spiral. At the other end, you may be pointing in any direction — including back into the oil. It can take several long seconds to get out.

Strangely, when the computer car hits a mud slick, it spirals through it and emerges at the other end pointing in the right direction.

Ah, well, that's artificial malevolence for you. So is the bug which occasionally turns your steering wheel into little clouds, and pushes you into the barrier to explode in flames. And so is the bug

which means that if you get the highest score and then try to restart, the computer won't record your score on the all-time greats list.

What makes the game worth playing, of course, is that you don't have to play on your own; and, more to the point, you don't have to wait for someone else to finish with the computer before it's your turn.

What makes it fun are all the little details: the crowd, waving flags which are the colour of the winning car; the little animated cartoon of the

driver who came last, vainly trying to repair his heap of junk; and the rescue helicopter, which cloppers overhead when you crash and puts a new car on the track.

Toasted pasta? Well, all you need is a pot filled with hot water, and enough pasta to feed whoever is going to eat. Put it on a low gas to simmer and, while it is cooking, go and have just one quick game of Super Sprint.

Miraculously, just as you are about to break the all-time high score, the smell of toasted pasta will reach your nostrils.

**This year's highly successful Which Computer? Show failed in one vital requirement: it introduced me to no new companies, and very few new products which had not been fully previewed before the show.**

Atari stayed away — for its own reasons which have little to do with a general assessment of the show. But Bob Gleadow, head of Atari in the UK, did offer a criticism. It was one I found damning.

'What the show lacks,' Gleadow summarised, 'is a place for startups to show what they've got.'

A trade show like this one attracts the big corporate DP buyers, the dealers, and OEM customers. They come to see what their normal suppliers are offering, and to collect on offers of a friendly drink and a chat about problems.

A small, penniless whizzkid firm with a half-complete piece of brilliant software, a prototype add-in board, or a design for a new computer, could catch the eye of the head of DP for Glaxo, say, or the Department of This and That, or the Institute of The Other. And, within a year, that product could be a market leader.

'That is the ideal way of getting the seeding,' said Gleadow, 'which a new company needs to grow its ideas.'

It would cost the Which Computer? Show's organisers, Cahners, nothing to have a little — or not-so-little — section of those enormous halls at the Birmingham National Exhibition Centre, where, for a flat fee of £100, partners, single-trader consultants, programmers and engineering startups could hang a board up with their names on, and give out typed sheets with their phone number and details of their new idea.

Cost, nothing — no, it might well make money. There was unused space at the show. Personally, I'd like to see some of that space given over to people called journalists. I have seen systems for distributing press information that were more like a dog's dinner, but not often. And I know that the organisers have seen how it ought to be done, because their publicity adviser has seen the Comdex system in the States.

But personal, selfish, needs apart, I think Cahners owes the industry this in exchange for the money it is making from the show. If you wish to join the lobby, the company is on (01) 891 5051.

## Chips for all

Last April there circulated a story that one of the first people to buy a new IBM PS/2 Model 50 was an employee from Chips & Technologies (C&T), the company whose chips have made PC/AT and 386 clones possible.

Supposedly, this person took the machine back to the company's Silicon Valley labs, and the hard work of analysing and reverse engineering started.

The story was true.

Now, some nine months later, C&T is ready to start producing its Micro Channel Architecture chip set. When used as part of a suitable motherboard, which C&T has also designed, it should be possible for manufacturers to launch their PS/2 clones.

Chips & Technologies is now three years old, and though vice president, Dado Banatao, is too bashful to admit it, the company taught IBM a thing or too about system integration.

The first IBM PCs and ATs used masses of TTL chips and the like, so that the component count on the motherboard was huge. C&T made some presentations to IBM about its own methods of partitioning the AT system into a small number of discrete, integrated components. Ironically, the new PS/2 range typifies and refines this approach so that reverse engineering the machines is no trivial task.

According to Banatao, anyone could reverse engineer a PC or XT in a garage in a month, but it needs the resources of a semiconductor company to reverse engineer custom chips. From his point of view he's bound to say that, but his warning does suggest that there won't be a flood of PS/2 chip sets from other manufacturers.

At the Which Computer? Show last month, Western Digital also showed its PS/2 chip set on a prototype motherboard together with the requisite new-style bus connectors. And alongside was a Mission prototype Model 30 clone, also based around a Western Digital chip set.

On present showing C&T looks like delivering its chips first, but the fact that graphics card manufacturer, Paradise, is a subsidiary of Western Digital may mean that a fully-integrated Micro Channel/VGA system will come from that quarter first. Either way, the move to match IBM's PS/2 offerings is now under way.

## Pirates back in the real world

'Software pirate goes to gaol', say the headlines. What in fact happened was that a crooked computer dealer went a step too far.

It's a very strange business, talking to one of these pirates, because they live in a totally artificial reality. And it's impossible to know how much of the real world they can actually see.

Recently, I found a communications program on a bulletin board. It had been recommended as 'excellent shareware — and British to boot' by another board prowler.

It was in fact an American program (and not a very good one, either) which a well-known crook had attempted to get distribution rights for. It was his own decision to make it into software, not the author's. Copies of it are now being distributed, in good faith, by users who believe they are legally entitled to make copies and give them to friends, who are obliged to 'register' the software only if they decide to keep it. Registering involves sending money to the pirate.

All is being done for the best, and when the money comes in, naturally some will be sent to the author; although to be frank, the author has conned the pirate so badly that he will be obliged to retain quite a lot of the revenue. In fact, the author probably owes him a quite substantial sum for marketing costs . . .

This man is still unprosecuted, although a court injunction prohibits him from keeping the software on his bulletin board.

The other pirate (who got caught) was Gerhard Martens of Torquay, who was more blatantly selling illegal copies of software. He was also selling fake clothes with fake labels in, so his operation had a wider scope than many computer shops. And one of his titles for his business was Second Hand Software — a strange concept indeed.

But he is not unique. Many computer dealers in the UK, forced by their own incompetence to spend too long on each sale, make up the difference between profit and loss by adding illegal software copies to the deal.

'Here is your Korwan clone, your Okson printer, and the bundled copy of 1-2-3 and WordStar,' they say to their

customers. Bundled? Only because they are illegal copies.

Martens was sentenced to 12 months in gaol. It can happen to other such pirates but, of course, they will carry on doing it because that's what they are good at — and at justifying their actions.

And, of course, when caught, these people are ace at accusing journalists of running scurrilous hate campaigns against them.

## Joining hands to outwit IBM

Everyone is supposed to raise a cheer at the sight of Apple teaming up with DEC, the world's second largest computer builder, in an attack on the dominance of IBM.

Not so.

An observation: if Apple and DEC break the 'dominance' of IBM, they will treat the market in exactly the same way as IBM does, only more so, because IBM has, over the years, learned to live within the law which has tamed it.

Another observation: Burroughs and Univac formed a joint company last year. The result: Univac customers are on the point of shooting their new supplier, which (they say) isn't treating them like the old one did.

A prediction: if the strategic alliance between Apple and DEC achieves anything at all, it will be a situation where each company suppresses inventions that conflict with the partner's current milch cow.

I'm sure I've said this before: why do the computer builders who are not IBM believe that we want *them* to be IBM instead of IBM being IBM? Our complaint about IBM is not that it is *called* IBM, but that it dominates the market and thereby makes innovation difficult. Any dominant company is likely to be as suppressive of good ideas.

And, judging by Apple's past record, I suspect it would be a lot more suppressive of ideas than IBM has ever thought of being.

## Upstart gets started

For people who like the idea of the NEXt machine which Steve Jobs (founder of Apple) is reported to be building in secret splendour in the US (see 'West Coast Connection', page 85), here is news of something more modest which aims to do something similar.

The idea is to use a PostScript driver to run the screen of a computer.

The company is Upstart

Corporation, founded by a name of equal note in the micro business, Lee Felsenstein, who originally became famous as the designer of the Osborne 1 portable CP/M micro.

His new machine, called Nomax when I saw him recently in Berkeley, is based on an Intel 80386 chip and has a high-resolution screen. The clever part is that, since the screen is generated by PostScript, a simple dump of the screen image to the printer is all you need for typesetting.

Well, it isn't quite that simple because, for a start, no screen will have the 300 dots per inch of most laser printers. But, since PostScript is resolution-independent, the same data that produces the screen will be fed to the printer, and the only difference will be that the printer is better quality.

As Felsenstein put it when pre-launch demonstrations were on in California recently: 'This removes the WYSIWYG issue.' What you see is *exactly* what you get.

What makes this startup Upstart company worth reporting is simple. When Felsenstein starts talking about new technology, it isn't because he has met some plausible engineer who has sold him on an idea (a dig at Steve Jobs — sorry, Steve) but because he has built a working prototype.

Backing him, Lee has several names worth the venture capital in their own right. Arvind Patel, who founded Paradise Systems, among five others — he is chairman. John Simpson, VP of marketing, was founder of Reflex originator Analytica Corporation after his time with DEC and Burroughs. Charles Woodford, product development VP, was founder of Selfware and author of WordFinder, the leading thesaurus product.

Felsenstein (here, let me quote from his press release): 'Felsenstein contends that Nomax will attract a large number of PC users who are reluctant to buy a Macintosh, but who want the benefit of Mac-like features and performance in their desktop publishing systems.'

With the Nomax box, Upstart will give away Windows 386 as an operating environment, making the beast perfectly capable of running any standard DOS program.

Anyone interested should contact Simpson in California on (415) 652 5393. Upstart is at 2200 Powell Street, Suite 880, Emeryville, California 94608. ▶

Presumably having traced an annoying source of sales (customers), Heptacon has found a way to prevent them from getting their fingers on software: a brilliantly irritating new copy-protection scheme. The manual cannot be photocopied, and each time you load a program, you have to put a template on a special code book and work out a startup code.

It's bound to work. I seem to remember losing my temper with programs which simply required me to have the original diskette as a 'key'. This thing ought to have even the most patient user in fits by the third day.

Brilliant!

# SUPER WIDE PRINTER, SUPERCALC SOFTWARE, SUPER SAVING OF £110.†

Now Amstrad can turn your PC into a complete business machine for just £299+VAT.\*

For this, you get a 15 inch carriage dot matrix printer, the DMP 4000, plus Supercalc 3.1, one of the world's leading number-crunching software packages. Supercalc takes care of accounting, stock control, modelling, graphs, scientific data - in fact most numerical applications you care to name.

The printer isn't just wide, it's fast: up to 200 c.p.s. draft, up to 50 c.p.s. near letter quality. And along with the software it's compatible with any Amstrad or other industry standard PC.

The offer is ideal for businesses, scientists, students and engineers. In fact anyone who deals with figures.

You won't find anything like it for a lower figure than £299 plus VAT.\*

Please send me further information on the Amstrad DMP 4000

To be the best, you've got to be good. Really good. And the modem below is an example of just how good a modem can be. It's a Hayes Smartmodem 1200™ with V.21, V.22, V.23. A

# GOOD,

"purpose built" modem that is specially designed and configured for international communications by Hayes,

the world's foremost PC modem manufacturer.

This 1200 bps modem is available in both a stand-alone version (Smartmodem 1200) and an internal version (Smartmodem 1200B™).

Along with all the requisite features, the Smartmodem 1200 is endowed with many ➔ automatic features—such as automatic speed selection, auto-answer and auto-dial, and an automatic speed buffer (flow control), a feature new to 1200 bps modems that compensates for different data rates between modems and computers. The Smartmodem 1200 also offers you full-duplex asynchronous, synchronous and autosynchronous (AutoSync\*) modes.

Another requirement for being the best is that you be better than everyone else. And that is exactly what Smartcom III™ is. As the most ➔ powerful communications software available, it has all the standard features you'd expect and more. Such as terminal emulators,

# BETTER.

unattended operations, error-free file transfer protocols, a peruse buffer, a full-featured editor, and full-featured videotex (Prestel) emulator.

So whether you're a power user or a complete novice, with Smartcom III you can take full advantage of Hayes' advanced modem technology.

Once you're so good that you're better than everyone else, you're the best. And the best is what you have when you use Smartcom III with our Smartmodem 1200. Together they represent not only the most advanced communications package in the UK today, but also the ability to be fully compatible with the world's largest and fastest growing international PC modem base.

# BEST.

The Hayes Smartmodem 1200, Smartmodem 1200B and Smartcom III are now ready for your perusal. They're worth a look. So take a look. These products are available through **Hayes Authorised Dealers** only. For one near you, call 01-848-1858. **Hayes**<sup>TM</sup>

## Pie in the sky

One of the best-kept secrets 'which everyone knows' last year, was the fact that Sir Clive Sinclair was working on a Transputer-based super-computer.

What no-one knew, of course, was exactly who the machine was for, and what it would look like.

The explanation for this has now emerged: Sinclair is probably *not* going to use the Transputer chip in his super-processor. Instead, he has discovered a new silicon design, in Cambridge, and proposes to use that instead.

Details of exactly who is doing the design, what it will look like, and whether it will ever be built, are available only in contradictory fragments.

Sinclair himself refused to be drawn in any way, except to admit that there was 'a real chance' that he wouldn't be using the Inmos parallel chip originally planned. Mainly, he says, this is because it doesn't understand memory management.

An ideal chip for multi-processor operations is one which absolutely and physically refuses to let data into a memory cell which is being worked on by another process. This kind of memory protection of cells in large or small banks is the one feature missing in the Inmos Transputer.

Talks between Sinclair and Inmos have, apparently, produced the admission that 'a piece of hardware to do that could perhaps be designed', which is not good enough for Sinclair Research, which needs to run Unix on the beast it is planning.

'It can be done — memory protection — in software, but it's very messy, with lots of overhead,' was how Sinclair himself summarised the problem. 'And you're right, it doesn't look as if we will be able to go with Inmos unless they do something new in hardware. And I admit it seems unlikely that they would have such a thing and not tell us about it. And they haven't told us about it.'

The attention focuses on the new superchip from this anonymous Cambridge guru. One source insisted that the design was actually Sinclair's own, from a subsidiary company. Another said that the inventor (unnamed) had been seen talking to electronics giants like STC and ICL, looking for finance. Still another ale house oracle

insisted that the machine was capable of 20 million instructions per second.

It's a safe bet that all this is pie in the sky. Next year, perhaps, something may come of it. But, for the time being it's probably something best relegated to the back of our minds, to await firm developments. Be sure *PCW* will let you have them as soon as they develop, er... firmly.

Meanwhile, back in Cambridge, at Sinclair's other company, it turns out that the folk at Cambridge Computer were every bit as aware as the rest of us of shortcomings in the PC Link software which

connects the Z88 laptop to a standard IBM family machine, for swapping data.

Anyone who was encouraged by our little item last month, suggesting ways of producing an alternative, should be warned: Sinclair was proposing to demonstrate a plug-in ROM chip of his own, come the Which Computer? Show (just after this column went to press).

'Just to let you know that we're working on it, and it will be out by May,' said one of the designers. Sinclair himself expects the price to be 'much the same, plus the cost of the ROM chip. Say, around £30.'

## Grapevine

**ST assembler:** a new version of Metacomco's macro assembler has been announced, 'providing a complete development system for 68000 assembly language programs.' The company says that it has bundled all the development tools from its Lattice C compiler into this product. Details from Metacomco at 26 Portland Square, Bristol BS2 8RZ, tel: (0272) 428781.

**IMS on micros:** Micro Focus has taken the natural step from Cobol to IBM's biggest, oldest and most unwieldy database, IMS (Information Management System) and has produced an emulation of IMS for the PC. It provides Cobol programmers with 'a complete IMS development system in which to code, test and run mainframe IMS applications on

From trauma to tower: the Apricot Xen-i 386

a standard PC.' Details on (0635) 32646.

Showing encouraging signs of having recovered from the trauma of its collapse two years ago, Apricot has launched the ten-slot 386 system shown above. For £4000, you get a 49Mbyte disk

system; for £5000, a 100Mbyte box. Included is high-resolution VGA standard graphics (no, I don't know if they are hardware-compatible or just BIOS compatible), 'Apricot fault-tolerant software' and 2Mbytes of 32-bit memory with Windows 386 running. It's called the Xen-i 386 Tower.

Not all DTP software comes from the States. **TypeCast**, from Unified Technology, is unusually fast, well spoken of, and comes from Manchester. It is now available in a new version (release 1.6) with 'greatly increased WYSIWYG accuracy and user-defined keys.' What it still doesn't do, apparently, is proof-reading: the company suggests a possible headline for this item of 'Martians land in Manchester'. Details from Unified Technology at 8 Canal Street, Manchester M1 3HE, or tel: (061) 236 8406.

**LocoScript spelling:** One of the great unnoticed smash hits of last year was LocoScript 2, a successor to the standard software in the Amstrad PCW word processor, at a piffling £20. Locomotive has followed this up with a spelling checker and corrector at the same price — LocoSpell. Special offer: buyers of both products pay £35. And LocoMail 2, the 'mailshot and arithmetic package' for LocoScript 2, will now cost £30, which is £10 cheaper than the original product. For those who can't find a dealer, Locomotive (software goes like a train) is on (0306) 887902

**Motorola** is putting a brave face on the fact that one of its biggest customers, Sun, is now building its own processors (the Scalable Processor Architecture, SPARC) using reduced instruction set technology; but panic is setting in at the Texas chip maker. It is reported to be linking up with Edge Computer of Arizona, a company which has made ultra-fast 68020 clone chips for its own computers. Motorola will sell these, which run at up to 16 million instructions per second, until its 68040 is ready. When? Some optimists say samples will be out this year. I'm not an optimist.

**Lotus** has a second Symphony, version 2.0 (price, £550). It includes 'extensive enhancements,' says the company, 'a direct response to our customers' requests.' Most, it adds, are go-faster improvements; others are done by including things (text outliner, spelling checker, terminal emulator, network filelock utility) which were previously sold separately. **END**

## Have you got what it takes?

*PCW* is on the hunt for two new members of staff. One will be a staff writer, the other will fill a more senior post.

Both positions require someone with a broad interest in and experience of personal computer hardware and software. You should also be able to write articles and reviews which meet the exacting standards of *PCW*'s editor. Applicants for the senior post should be currently employed as a computer journalist and have a technical or business computing background.

Needless to say, you'll already be a dedicated *PCW* reader and be yearning to get your hands on the up-to-the-minute products that fill our pages. You'll also be expected to research and write features.

If you think you're up to the challenge, this is what you need to send us as your application:

1. A summary of your education and work experience.
2. A description of the computer hardware and software you own/regularly use.
3. A 1000-word review of a piece of business hardware or software in the *PCW* style.
4. A short critique of this issue of *PCW*.

Applications should be sent to the editor, Derek Cohen, at Personal Computer World, VNU House, 32-34 Broadwick Street, London W1A 2HG, to arrive by 10 March 1988.

# Towards the NeXT generation of high-power PC graphics

Over the past two years, the personal computer has become a very powerful machine.

Fifteen years ago, a computer the size of a 10ft x 15ft room would have been needed to give the same computing power as today's desktop 80386 PC. One of the economic principles that drives the industry is that 'the more

**Steve Jobs: set to dazzle the computing world with a new-generation PC woven with 'incredible technology'. Will it be tomorrow's trend?**

computer literate the user, the more power they will demand.'

This alone should give you a hint of what future PCs will be like, and 1988 is the year the personal computer will be transformed. Soon, Steve Jobs, founder of Apple Computer and now president of NeXT Inc, will unveil his new personal computer.

This machine, originally thought to be just a high-powered workstation for the education market, is actually a computer that could push PC technology to its limits and define the design of the next generation. And sources close to Jobs say that it will be available for the business community as well.

Steve Jobs has already given the world two computing standards in the Apple II and Mac lines. His associates confirm that he really believes he is a technological messiah who will bring the world the next generation of PCs.

According to sources close to NeXT, Jobs' new machine will bring high-power graphics workstation capabilities to a personal computer costing less than \$10,000. This machine will bring the personal computer and graphics workstation even closer.

Much of this technology has come from Jobs' 1987 acquisition, Pixar. This company sells high-end graphics workstations and was founded by George Lucas,

director of *Star Wars*. It produced much of the computer-aided graphics in his films.

Now Jobs has taken part of this incredible technology and woven it into his new-generation PC design. Using his own windowing front end to Unix with Display Postscript, he will, in essence, give us a personal computer workstation more dazzling than anything else for the same price.

Although many people question Jobs' ability to succeed at this venture, most people are convinced that his machine will push technology forward and cause major ripples in the world of computing.

At the same time, traditional high-end workstation companies like Sun Microsystems and Apollo are bringing their prices down and adding more graphics capabilities to these low-end workstations: PCs and workstations are quickly becoming one. In fact, Sun will very soon introduce an 80386-based system that has its SPARC RISC chips integrated into a standard PC configuration.

And, if you take a close look at Apple's Mac II, you can see how it could quickly grow up into a serious workstation and eventually compete with Sun, Apollo and NeXT.

Take a good look at the serious graphics workstation. This will be the PC of 1990.

**TIM BAJARIN**

**This month's American news showcase features details of Steve Jobs' plans for his NeXT generation; who showed what at Macworld; and news of home rule at CES.**

design tool and its interactive nature.

Many companies like E/Machines and SuperMac showed their new colour screens, but RasterOp showed the only 24-bit colour screen and dazzled attendees with its incredible visual effects.

Although there have been great breakthroughs in colour displays, colour output is still far behind. The one machine that did show promise came from Maris Technology. This company is backed by Apple's Venture Capital fund and makes a high-resolution slide-making device. The unit is half the size of Presentation Technologies' Imagemaker, and can produce slides of up to 8000-line resolution.

Another item that attracted a lot of interest came from Orchid Technologies. Its ColorView/SE card fits into the one open slot in the SE, and allows the user to then plug in a separate colour monitor like the Mac II colour monitor, an IBM VGA monitor, or another compatible monitor. The price of the board will be around \$695, and with a colour monitor would likely be under \$1000.

Another product of interest came from Radius Inc, the company that produced the first large-screen display for the Mac. Its SE accelerator card, with a Motorola 68881 co-processor, makes the SE run as much as 10 times faster than it presently does, with just a 68000 chip. It will retail for around \$1000, and should be available now. ▶

## Joint Apple/DEC announcement at Macworld

This year's Macworld (San Francisco, January) was overshadowed by the announcement that Apple and Digital Equipment would enter into a joint technology agreement, thus allowing the two companies and their technologies to be part of a powerful global computing solution.

This announcement came hot on the heels of a similar agreement between AT&T and Sun Microsystems, as AT&T has agreed to purchase 20% of Sun's stock. We now have quite a battle shaping up

between Apple/DEC, Sun/AT&T and IBM for the dominant position in the PC/workstation market.

The important part of the Sun/AT&T alliance will be that Sun will have access to the merged Unix 4.2 and 5.0 as much as 18 months before the competition. But, Apple's own AUX (Unix) system will be out soon, and when the Apple/DEC technology links into DEC's OSI, Apple and DEC will become a powerhouse to be reckoned with.

As for the show itself, it had few surprises. The most interesting rumour on the floor was that Ashton-Tate had bought the long-awaited FullWrite package from Ann Arbor Software. This was confirmed by two Ashton-Tate sources who asked not to be identified; and, according to

these sources, Ashton-Tate will finish some housekeeping on the project and release it under its own label in the Spring. A pre-release copy will be shipped to those who have already bought the product, but it is not in any way the finished version.

The most exciting game at the show was Silicon Beach's Apache Strike Force. This drew a rave response from the crowd, and those who have played it say it is the most addictive action game they have ever seen.

Claris, Apple's software spin-off, showed one product that really drew a lot of attention. Besides upgrades of MacPaint, MacDraw, MacWrite and MacProject, the company's new forms package, SmartForms, showed the true flexibility of a dedicated forms

## CES, Las Vegas: highlighting the slumbering home scene

The winter Consumer Electronics Show, held in early January in Las Vegas, saw many new products for the home market. During the early eighties, this was the dominant show for home computing. But, when the home computer market dried up around 1984, so, too, did this part of the show.

Although the home market has not recovered by any means, there is a glimmer of hope for those whose main interests lie there. Here are some highlights.

### Home work

If Japan's biggest computer company, NEC, has its way, the next trend in the US will be the home office, as the company made plain at this year's show.

The home office should have a personal computer, copier, facsimile machine, modem and two-line cordless phone.

Although this may seem like the system for the workaholic, it will soon be the basic standard for corporate executives who want the convenience of working at home, and small businesses that operate from the home.

And the prices of the individual components have come down in the past year: a good PC can be bought for under \$1000, and personal copiers are now about \$695; modems can be as little as \$50, and Murata has just introduced the personal fax/phone for \$895. This looks very much like a standard telephone, but includes the fax modem and paper in its design.

The bill would be £3000.—an exciting prospect for manufacturers and consumers alike.

Although the electronic cottage has only been a dream, at these prices and with technology becoming more portable, it could soon be a reality.

### Real frightening . . .

Those of you who are Flight Simulator fans get ready for the ultimate Flight Simulator. This product has been so popular on the PC that it is used as a compatibility test for clones.

There has been a flood of flight-simulator type products, the best-selling being Chuck Yeager's. Most recently, Falcon for the Mac has been released.

There is also Dam Busters, F-15 Strike Eagle, Jet, Apache Strike Force and others.

The ultimate, though, may be one from Electronic Arts. Code-named Interceptor, this is the best flight simulator I've seen yet on just about any machine, except a giant Evans or Southerland machine used by NASA to simulate the space shuttle.

The first version is in full colour and runs on the Amiga. Developed by Intellisoft, and arms treaties notwithstanding, the program puts you in the seat of a jet fighter loaded to the gills with weapons. You have lots of assignments to fly and hold the lives of everyone, from the President to the troops, in your hands.

This is by far one of the most realistic games I have ever seen. I had the task of saving the President from a couple of incoming MIGs about to attack Air Force One. Just as well it wasn't for real: they blew up the President's jet and I had to run for my life.

Another scenario had me fighting off incoming MIGs which were going to attack San Francisco, and I accidentally blew up the Golden Gate Bridge.

Believe me, the realism of this game is frightening, and addictive. Initial release will be on the Amiga, but PC and Mac versions are close behind. Expect the price to be

somewhere in the \$39-\$49 range.

### . . . just for fun?

360 Software, a new firm founded by Tom Frisina, former president of Accolade, has just bought the rights to the popular Dark Castle game for the PC from Mac developer, Silicon Beach Software.

But the game which the company will release soon will be an electronic version of the popular board game, Harpoon. Developed by Larry Bond, this board game was the inspiration for the best-selling Tom Clancy novel, *Hunt for Red October*.

So, 360 Software will soon have a very life-like game that has you chasing a Russian sub as it tries to defect from the Soviet Navy fleet, and you must protect it and get it to a US port safely.

The PC version will be out in March, with the Mac and Atari versions available in May. Frisina is a kid at heart, and you can always count on him to produce the best games software you can buy.

360 Pacific Inc is on (408) 879 9144 (US).

### Kids' stuff

Although many hardware manufacturers attended CES, including British giant, Amstrad, PCs have become more like appliances so similar

to each other that pricing becomes the most important part of a company's marketing programme.

With Korean and Taiwanese manufacturers taking a very aggressive profile, you can expect to see some real price wars in 1988. In fact, some analysts believe that we will have 8088-2 based systems with monochrome monitors and dual disks for as low as \$499 by the end of 1988.

But when it comes to hardware and software trends at this year's show, you had only to go to the Nintendo booth to see what is happening. It was the largest there and showed some 23 new software developers.

According to a Nintendo spokesman, by the end of the year there will be more than 300 games available for the company's machines.

And traditional software developers like Broderbund, Mindscape and Activision used the show to announce that by mid-1988, they would each have at least three of their popular titles available for the Nintendo games machines.

In Silicon Valley the Nintendo machines are the latest craze, especially when the home already has a PC and parents buy a games machine to keep the kids off their own computers. I bought my nine-year-old a Nintendo for his own use after he wiped out two mice on my Mac and one keyboard on my PC while he was playing games.

These dedicated games machines seem destined to be the main medium for home computer entertainment.

## Casting light on handheld spell-checking

Spelling checkers and thesauruses are now a basic part of most word-processing technologies. It is very easy, even in the middle of a document, to call up the RAM-resident spell checker for something you're unsure of.

The most impressive spell-checking technology available comes from Xerox' Palo Alto Research Center (PARC), one of the most innovative research centres in the world.

Sold by Microlytics, an entrepreneurial off-shoot of Xerox, this spelling technology is finding its way into many word processors. It may also be found in a new device from Selectronics that even non-

The handy WordFinder

computer owners can use.

Incorporating powerful compression technology developed at PARC, Microlytics and Selectronics have together developed a small hand-held computer which will check the spelling of 100,000 words and 220,000 synonyms in its

comprehensive thesaurus.

According to Mike Weiner, president of Microlytics: 'Now writers, especially those who don't use a word processor, can have immediate access at any time to the most advanced spelling verifier and the most widely used electronic thesaurus available.'

The 6oz, battery-operated WordFinder uses two microprocessors for instant response, and comes with 4.5Mbytes of information compressed on a 256k chip.

With the spelling checker you can leave as many as three letters out of a word, and it will still find the word and spell it correctly. It will be a great companion to those who love crossword and word puzzles. It easily fits into a pocket and will cost \$99. A UK English version should be available by early summer.

Selectronics is on (612) 545 6823 (US).

END

# ROLAND PLOTTER PLOTTER PLOTTER

Whichever area of CAD you're working in, when it comes to specifying an A3 plotter, a Roland machine adds up to a whole lot of plotter!

Boasting proven design and performance reliability that has made Roland DG the number one name for A3, the range comprises four 8-pen flatbed models. Each is value packed courtesy of the very latest in PCB technology and, collectively, they cover all the user requirements of this popular format. Prices begin as low as £795\*.

From the DXY-890A, the ideal introduction to A3 and widely used throughout the education field; to the advanced DXY-990, offering fast, high-precision plotting with sophisticated pen control features and electrostatic paper hold.

The DXY-980A and DXY-885 complete the line-up and are keenly priced according to their facilities. Roland A3 plotters offer full RD-GL and HP-GL\*\* compatibility, and interface with all leading micro computer systems.

Buying a Roland A3 plotter is as trouble-free as using one. From any of over one-hundred and thirty authorised UK Roland dealers, in fact. For more information, give us a call or send for our individual A3 range colour brochures.

\* Retail excl. VAT.

OUR UTILITIES SOFTWARE AVAILABLE FOR ONLY £24.99 WHEN ORDERED WITH A DASHBOARD

Just about everybody agrees that using an "enhanced" keyboard is a great improvement. But it can also be a great expense - and if your investment has gone into AMSTRAD PC1512\* machines it will also prove a great difficulty.

At ELECTRONE we decided to do something about all this and set out to produce the DASHBOARD. It is reasonably priced, comes in two versions - one to fit the AMSTRAD port and one to fit the IBM† standard port (which means it will work with most industry standard machines available).

But there's more. Like all our keyboards, the DASHBOARD is "soft," which means that if you buy our easy-to-use DASHBOARD UTILITIES Software you can dedicate keys to perform selected tasks whenever you want.

Consider the possibilities. Whole macros at the touch of a button (even if your software doesn't have a facility for macros), regularly used sentences, paragraphs or whatever, again at the touch of a button - then there's all

those hard to remember printer control codes, you can store those on whichever keys you want, if you're writing software you can even store mini programs on a button.

The potential is virtually limitless, because you can use each key in all its modes and you can change the whole keyboard configuration according to what you are doing.

So, if you want to enhance your machine with something a bit more meaningful we suggest that you fit a new DASHBOARD and for extra acceleration, install our DASHBOARD UTILITIES and really start motoring.

# OUR NEW DASHBOARD<sup>TM</sup> MAKES YOUR MACHINE EVEN FASTER

# The Olivetti collection

**VERSATILITY  
THE M280**

**POWER  
THE M380**

**SPECIAL PROMOTION!  
FAST NEW M240  
FOR THE PRICE OF OLD M24!**

**SUCCESS  
THE M24**

**VALUE  
THE M240**

With the success of their M24 Personal Computer, Olivetti became Europe's No. 1 IBM compatible manufacturer.

That was just the beginning. Now they have a new range of PC's. Each model, the optimum combination of processor performance and system capacity.

Which means that whatever your PC requirements, Olivetti can provide a solution. From basic workstations to a departmental supermicro.

Choose the M280 for a very fast 80286 system suitable for MS. DOS, Xenix or the new OS/2. Its speed and flexibility can handle almost any application, alone or at the heart of a network.

The M380 provides a powerful

solution for advanced multi-user or networked applications. Its 80386 supermicro performance is matched by enormous memory and disk expansion options.

For the ideal PC or LAN workstation, the M240 takes the superb display and easy expansion of the M24, and adds even faster performance.

Yet we won't add anything to its price. (For a limited period you can buy the M240 at the price of the old M24). You might call it a value added promotion.

But then, nobody sells Olivetti computers quite like us. We give you the prices you want, and the services you need. For complete systems for accounting or desktop publishing, we'll give you informed

advice before you buy, and technical support afterwards. We can arrange your software training, and maintain your hardware in case of problems.

But there's one thing we won't do. We won't ever write you a bill, and forget to be competitive.

# Riding the hobby-horse to nowhere

The advert on the page next to Martin Banks' 'Unreal Time' piece (*PCW*, November 1987) should make his heart leap with joy and cause a little earth to move around Biggles' grave.

As he is addicted to simulated flight programs, the warning in this game's advertisement will be branded on his heart: 'REMEMBER — TEST PILOTS ARE ONLY WRONG ONCE!'

What if the same warning applied to feature writers? The sobbing millions that filtered past Lenin would be nothing to the queue applying to replace Mr Banks.

His is the first page I turn to in *PCW*. He consistently exercises a mastery of the chosen subject that fits exactly into the limits of his space.

The reasons for the article's bellyflop are obvious. He has built a hobby-horse out of a gut prejudice, harnessed it with sellotape and stamp edging, and tried to ride it without a saddle to nowhere in particular.

There is a problem in responding to people who have intestinal hunches that sex crimes would stop if extramarital cinematic mammalaria were denied us; that knife-aided mugging would disappear with Sylvester Stallone; and that murder would nearly cease with the return of the gallows.

These cheap excursions into cause and effect produce neat, apparent solutions tailored by demagogues for the mass market, that match the craving for simple answers. They are seldom thought through. The effort towards birth control in India has revealed the existence of a number of rural people who were unaware of a relationship between copulation and babies. In the UK, it has taken more than 90 years for it to be popularly understood that there is a relationship between sugar consumption and bad teeth. Dentistry cannot compete for column inches with rape, but for many of those 90 years the popular villain was nuts.

Yes, I know Banks' subject was computer games and not hanging or cinema/TV, but is the difference vital? He suggests that prolonged exposure to computer games can alter the values and so, presumably, the behaviour of people so 'addicted'. The thought is perhaps less simple and more revolutionary than he imagined. If our would-be

guardians have stumbled upon a real cause of change in human behaviour, the process can be developed and refined. Factors will be isolated and the intractable, inconvenient human being will disappear in a monthly dose of educative screening. Oh, brave new world!

**Gordon West,  
Tavistock, Devon**

*Martin Banks replies: Gordon's letter was, sadly, too long to be included in toto, for it made a fascinating read based upon a veritable cornucopia of ideas.*

*Gordon commits considerable effort to demonstrating that people are not affected by the images continuously thrown at them by the media and, more recently, by the arrival of the computer game, then seems to use the (to me, contradictory) evidence of the manipulation and distortion of impressionable minds by religious sects to show that it doesn't happen.*

*While I acknowledge*

*immediately Gordon's observation that the points I raised in 'Unreal Time' will be an obvious focus for the jingoists and mega-moral and self-righteous tub-thumpers, this does not mean that they are consequently invalid. Even though evidence exists which proves that images have no effect as role models, as Gordon points out, there has to be some doubt.*

*Take just one area I have a little knowledge of. There is a welter of evidence to suggest that soft-pornography has no effect on men and their attitudes to women. There is also no evidence to the contrary. QED, and so on.*

*However, ask American author, Andrea Dworkin, about the obstacles to getting such contrary evidence actually published and out into the public domain. Not being in the library is no guarantee that it is not there, somewhere.*

*All I would say is that, if the manipulative power of images does not exist, then the likes of Saatchi and Saatchi have built more than a sizeable fortune*

Send your letters to Derek Cohen, 'Letters', *Personal Computer World*, VNU House, 32-34 Broadwick Street, London W1A 2HG or contact us on Telecom Gold 83:VNU200.

out of . . . what?

*If the effect of such power on younger minds is a figment of my jingoistic mind, then why do psychologists and the like now refer to a new phenomenon, the Wannabees — young children overly affected by those same images.*

*If, as has happened, a man can, while raping a woman, blithely tell her that she should appear on Page 3 of the Sun, then surely there has to be scope for the question to be asked.*

*And the question? Simply that, given the evidence that any image can have an effect on its recipient, and that that effect can have a negative impact (especially on other people with whom the recipient interacts), then shouldn't those responsible for the images seriously examine all the consequences of using them and temper such utilisation accordingly?*

## Wij hebben de ij

We, the Dutch, think our language deserves to be included in the 'quite extensive research' Mr Quirke has conducted ('Ever been had?', Letters, *PCW*, January).

The *ij* is a composition of the letters *i* and *j* and is pronounced somewhere between 'ai' and 'ei'.

We think, in fact, that IBM has not gone far enough, as we would have liked our 'ij' as a unique character rather than borrowing a 'y' and putting two dots on top.

We flatter ourselves into thinking we influence IBM's decisions.

**HM van Binsbergen, Swindon**

## Dozy processor

I'd like to congratulate Robtek on admitting that it made a mistake with the dreadful PC emulator for the Atari ST, MS-DOZ, and replacing my copy with the much superior PC-Ditto for just the difference in price.

MS-DOZ promises only 70% IBM compatibility, and some of its functions only work some of the time. To execute 'Flipmode', for example, you have to press the required key many times. Would you buy a word processor that expected you to press a key a number of times before the character appeared on the screen?  
**Jesus Consuegra, Barcelona**

## Mouse trap

Nearly every PC machine is sold with a mouse. Because the mouse works by clicking buttons and needs a lot of desk space, it is frustrating for drawing free-hand. The Light Pen by Electric Studio, designed for the Amstrad PC1512, has a major limitation: the mouse is still required to click buttons when using the light pen.

Light pens with built-in clicking buttons would make things very easy. I hope someone is working on this.  
**Manoj Nathani, London**

*I hope someone is working on this.*

## One side of the service coin . . .

It's good to see that some companies marketing micros do provide a decent service ('Service with skill', Letters, PCW, January). I suspect, though, that the other side of the coin is a good deal more common.

I bought a QL in 1985 and always intended to upgrade it. By this year the memory and disk upgrades had come down in price, but so had the price of PC clones; and I discovered that a new clone with 640k and twin floppy disks was about the same price as the QL upgrade.

To cut a very long story short, I bought an SRC FD which uses the NEC V40 chip.

The dealer, Regent Computers, was told that I wanted to write numeric applications in Fortran and so needed to install an 8087 chip. To save other readers the agonies I have suffered, they should be aware that fitting an 8087 into an SBC FD is not easy because the socket on that machine is for NEC's own version — the  $\mu$ PD72191. However, NEC has never produced that chip, and it took weeks of pestering the Spectrum Group headquarters to get the converter board so I could fit an 8087.

I played with various 8087 chips running at various speeds, and discovered that one running at exactly 8MHz

was the only one that would work, though it did start disabling the real-time clock and sometimes needed the hardcard I had installed to be removed and replaced before it would function properly.

Finally, I discovered that the Fortran package I wanted to use would not work.

Regent is still trying to configure a fully-working 8087-equipped micro for me.

KJ Vines, Altrincham, Cheshire

*If your Fortran and 8087 were working properly, you can count your blessings that you were knowledgeable enough to know who to contact and where to get the expert advice you needed.*

## . . . and here's the other side

I must say I agree with Christine Argyle's letter about the poor quality of service from computer dealers. ('Letters', PCW January). The general trend of salesmen within the computer industry is verging on the abysmal.

It's so bad that although my company started off as an aviation consultancy, we kept the original name when we moved into computing. To quote one customer: 'When I want a computer, the last place I need is a computer shop.'

It is frustrating for a customer to go into a shop with a simple computerisation problem, only to find costs escalating as a keen salesman goes off at several tangents.

I waste so much time unravelling other dealers' handiwork that I would like to say one thing to them: if you are a box shifter, please say so. Don't disguise yourself as someone who knows what he is talking about and give the rest of us a bad name. Then maybe we won't have to apologise for being in the computer trade.

Phil Croucher, managing director, Air Movements, Warrington, Cheshire

## Z88 wish list

Guy Kewney's problems with the import/export utility on the Cambridge Computers' Z88 (PCW, September 1987) were somewhat exaggerated. If he has such problems typing IMPEXP88, then he can rename the EXE file to something more memorable.

On the version I have, files transferred between the Z88 and PC default to the same file name if at all possible, including the directory. So, having the same directory structure on both machines saves wondering where the

files end up after transfer.

Having said all that, it would be nice to be able to mark a group of files for batch transfer.

There are two spare slots in my machine waiting for someone to tempt me to part with some money. Here are my suggestions.

I have become used to a spelling checker on my PC. I am sure that my limited vocabulary would fit into 128k when suitably compressed.

Even though Pipedream is acceptable as a word processor, I would probably invest in a better one especially if it had some

outline processing facilities.

The most necessary extra would be a decent manual.

AR Hapson, Tonbridge

*Having just taken a Z88 round the world, I too have a love-hate relationship with it. I can't get the space bar to work properly, so an improved keyboard would be on my list. And it bombed out on me, thus losing an article, so an external disk drive, or a more secure form of mass storage, would feature prominently. Using battery-backed RAM packs, like those on the Psion Organiser, also seems like an obvious enhancement.*

## A woolly blanket over software piracy

Martin Banks' defence of copyright (PCW, December 1987) atoned for a previous piece (PCW, October 1987) which was equivocal, to put it generously, about software piracy.

He referred to software developers as an 'unscrupulous bunch of self-interested thieves'. This is a much more cynical view than that held by those who are working hard for an environment in which the creation of a wide choice of cost-effective software is worth the necessary investment of skill, time, money and effort.

Being woolly about piracy costs the consumer both money and choice. If a significant proportion of the computers we use had been stolen rather than bought, fewer machines would be developed and marketed, and

the reduced financial return would inflate the price of every computer sold.

There is no way that computer programs can escape this same reality. Donald MacLean, chairman, Confederation of Information Communication Industries

*I suppose if few people bought PCW, and most people photocopied their friends' copies, the only people to gain would be the photocopier manufacturers.*

## Politics out of touch, and out of place

Resident guru Guy Kewney seems to believe that the worst thing about Toshiba executives selling prohibited technology to the Soviets is the politicking in Washington over the affair ('Toshiba, treachery and the American

way', 'Newsprint', PCW, October 1987). Instead of heaping scorn on those who would sell out the Western world for a few yen, Kewney casts aspersions on congressmen who call for a ban on Toshiba products. Furthermore, he attempts to dissuade Britons from taking similar action against Toshiba by presenting the feeble argument that US weapons sales to Iran equals treason against the Free World.

Fear not, would-be traitors. Not enough people understand what is happening for this matter to affect the supply of computers to the UK. Now, if only our misguided souls worried as much to protect our freedom as they do the supply of computers . . . In all, bad one, Kewney. Keep your political opinions to yourself. Alan Thibideau, Apricot Preserve (user group), New York

*We could, of course, take the British line of fair-mindedness and sell computers (and arms) to both sides and sit back to reap the profits.*

## PCW9512 — not perfect quality

I'd like to comment on John Donaldson's review of the Amstrad PCW9512 (PCW, October 1987).

The new daisywheel printer is good for letter quality but does restrict users to text only. This is a pity, as the original PCWs were some of the best CP/M Plus machines available. Amstrad could have offered a dual-function printer.

The use of a daisywheel also creates difficulties for those users like myself who need access to non-English character sets. Previously, some clever programming could produce the desired characters but this is no longer possible.

Some future developments that Amstrad might like to consider include offering a hard-disk expansion for the machine, an 8256/8512 dot-matrix printer with the 9512; and the daisywheel printer as an option for the earlier models.

Jaroslav Młodzki, Warsaw, Poland

END

# YOU DON'T NEED TO BE AN ACCOUNTANT TO SEE THE VALUE OF AMSTRAD SOFTWARE.

If you have any knowledge of what accounting software usually costs, it won't take you a second to see that Amstrad's Accountsmaster and Paymaster packages offer an exceptionally good deal.

Accountsmaster is an integrated accounting package that includes nominal ledger, purchase ledger, sales ledger, invoicing and stock control.

It is sophisticated enough for the most demanding accountant, in any small to medium sized business.

Yet it is so simple to use and easy to understand that you don't really need any accounting skills or even much knowledge of computers.

You could pay up to £3,000 for a similar package and still find yourself with a less comprehensive product.

So at £149.00 plus VAT,\* you're getting the

kind of bargain that has Amstrad written all over it. And if you want to extend your Accountsmaster program to include a payroll facility you can pick up the Amstrad Paymaster software for just £49.00 plus VAT.\*

Or you can use Paymaster on its own. Either way it can take care of all the payroll needs of as many as 999 employees, with just about every facility and feature you could need.

Accountsmaster is available exclusively for hard disc machines.

Paymaster works with single, double and hard disc machines. Both are compatible with Amstrad PC's and any other IBM compatible PC.

So whatever your financial headaches, they can definitely be eased by Amstrad software.

\*Recommended retail prices including VAT. Accountsmaster - £171.35, Paymaster - £56.35. Prices correct at 1.1.88 but may change without notice. Software subject to licence. Products subject to availability. Amstrad is the registered trademark of Amstrad plc. All rights reserved. Available from your registered Amstrad dealer.

Please send me information on Amstrad Accountsmaster and Paymaster software packages.

# Ignorance is bliss

**Confusion! What will users do with all this Transputing? Can they afford it? Do they need it or could they make do with something less sophisticated? Would they know? Martin Banks racks his brains.**

**T**he brain is all a bit of a jangle today. Lots of different ideas and notions are banging around in there, bumping up against one another and not reaching any clear conclusion.

This is partly because the signals are really quite conflicting, yet I feel I should be able to resolve them into some sort of coherent whole. For example, I get the feeling that there ought to be a direct and obvious connection between the pace of technological development and the apparent fact that many users are 'selling' themselves extremely complex 'pups' that they do not really want.

The only conclusion I come to, however, is one for which some readers have remonstrated with me; namely, the apparent suggestibility of the human race. Tell a human being in a suitably convincing way that it needs something and said human will not only need it *but demand it*, regardless of the often self-evident fact that it is the last thing on this forsaken earth that it actually requires.

Just for the moment, however, let us focus on the other theme for this month — technological development. I have recently had the opportunity to hold in my hand two interesting add-in boards for the PC XT or AT. One comes from the UK company, Gemini, and the other from Definicon in California. Both add Transputer-based processing power coupled to vast amounts of memory, all packed into the few square inches of a PC expansion board.

One tends to look at these things and think '.....!' (well, this is a family magazine). Anyway, one is impressed. Vince Williams, Definicon's founder, put it into perspective with the throw-away line: 'You are holding in your hand the equivalent of one twentieth of a Cray supercomputer.'

At about £4000 per board, compared with, say, \$25 million for a reasonable Cray supercomputer (not to mention the cost of the plumbing to get

the watercooling system fixed up), one can see the awesome potential that is being made available, and work out the relative costs. It is possible to see why boards like this are generating a great deal of interest among the *cognoscenti* of personal computing.

So, we can sit and marvel at the wonders of technology, and make all sorts of assumptions about how, where and when it could be exploited. But the question must then be posed: the *cognoscenti* might love the technology, us clever-dick pundits will love prognos-

tions problems. Where, for example, only a weekly update on sales and prices between a branch office and HQ was needed, the obvious solution would be to buy the same make of PC for each location and send a disk through the post or by courier once a week.

Instead, according to the consultant, the users would complain that such solutions were obviously too simple, and that what they wanted was a 'hi-tech' system with lots of different machines and a fearsomely complicated net-

**'... whole sections of British industry... are buying up high-technology gizmos in the belief that they are extremely clever solutions to something or other.'**

tating about it, but is it where the users are going? Are they, indeed, shooting off down a blind alley, as often seems to happen?

Two recent occurrences propose the thought that this is what might be happening. One comes from a conversation, while the other comes from a survey of information technology users.

The conversation was between yours truly and a consultant (yes, yes, consultants know nothing, I am aware of that). Said consultant, however, was making an interesting point. In his experience (and he'd had a bit, selling PC-based software for a good many years) many customers would not accept a simple solution to their business problems. They would not, for example, accept the fact that actually getting their paper-work systems working properly would be a jolly good starting point.

They would also have grave doubts about obvious solutions to simple communica-

work operating over leased lines. That, as they say, would do nicely.

In other words, if the users can understand the solution, it can't be hi-tech; and if it isn't hi-tech, then it can't be a good enough solution. I would venture to suggest that the underlying cause of this thought-process can be found in the advertising the computer industry puts out, but others would counter by saying I am once again underestimating the intelligence of the perceivers of such advertising.

I might even have thought that it was just the whinging of a frustrated consultant had it not been for a survey published by the Kobler Unit at Imperial College in London (I do hope nobody will draw a relationship between the unit's name and the veracity of its survey). This showed, in essence, that UK companies investing heavily in information technology are not necessarily gaining any business advantage from the process. In particular, it suggests that they

**MARTIN BANKS**

are failing to make effective strategic use of IT, and are not applying sufficient quality control to their investments in the technology. It would not be going too far over the top to say that, maybe, they are not thinking about their investments too carefully. Surely it couldn't be that they are buying gear that is enormously clever, but which they do not understand?

If such a thing were true, then whole sections of British industry (and no doubt industries around the world) are buying up high-technology gizmos in the belief that they are extremely clever solutions to something or other. The trouble is, they are not quite sure what that something or other actually is, nor whether the high technology is any good at solving it. All they know is that it must be right because it's high technology, and anyway, the advertisements say it is the answer.

It all seems rather sad somehow. Here we sit with a technology blooming and growing around us that does have tremendous potential, if used right. Yet we seem to have rapidly moved into a situation where one word, 'judicious', is rarely found in close relation to some others, such as '... use of technology'.

And so back to the beginning. The Transputer has a great deal going for it, but just think about what might happen if users start demanding it as a solution to whatever it is that they think might corporately ail them. Some users are going to end up with the most comprehensively complicated dog's breakfast the world has ever seen. Worse, however, is that they are going to be appallingly smug about it. **END**

# Dell System 200

One of the first companies to revamp its product range with OS/2 in mind, Dell has produced a reliable substitute for the 'real thing'. But competitive price does not make for an earth-shattering performance, as Peter Jackson found out.

**A**t the giant Las Vegas Comdex Show in November 1985, visitors could be seen pushing past a hippy in a check shirt as he handed out promotional flyers in a walkway between exhibition halls; flyers announcing a \$1999 breakthrough in the price of AT clones. The hippy-hiring manufacturer was Texas-based PCs Limited, now much bigger, much more respectable, and known in the UK as Dell Computer.

But that initial approach to marketing was typical of the Dell strategy, initiated by founder Michael Dell and carried through into massive US success and the opening of a UK branch last year. The strategy is to offer high technology cheap by cutting out the middle-man and selling direct to end-users, at aggressive prices but with professional-level support and, these days, with Dell-designed products. That has not always been the case; some of Dell's low-end products were originally manufactured by the American Research Corporation, for example, and these are still being sold in the US.

Now, with the System 200, Dell has refined its plans for the era of PS/2, OS/2, 3½in disks, and VGA graphics. Indeed, the new system is one of the early signs of the expected flood of 'hybrid' PCs; machines that have the same disk drives and graphics displays as the PS/2 and which can run OS/2, but which also use the old PC and AT expansion buses rather than the PS/2's Micro Channel Architecture.

And the need to produce this new system has also given Dell the chance to refine its board design, put in some sighting marks for future enhancements, and still keep prices as low as they can get. The System 200 is an interesting combination of budget pricing, features tailored for the new post-PS/2 world, and high performance, and is aimed at replacing the company's earlier AT-compatible systems.

## Hardware

From the outside, the System 200 looks exactly like the older 2868 and 28612 AT clones from Dell, in the characteristic Dell casing that is bigger than an XT but a fraction short of full AT height. The only obvious difference is the presence of a 3½in floppy drive in one of the two half-height floppy disk slots in the front panel, fitted with a standard 5¼in bezel to match the standard 1.2Mbyte 5¼in drive above it. In fact, System 200 customers have the option of buying machines with either floppy drive as standard, with the other type as an extra-price option.

Setting up the System 200 is a

simple matter of connecting the keyboard and monitor to the appropriate sockets, plugging in the mains cable, and flicking the power switch. The only slightly unconventional feature is that the EGA monitor is powered from the outlet on the back of the machine rather than from a separate mains lead — another of the benefits of a beefy power supply.

As usual, the machine boots off the hard disk if MS-DOS is present on it, or from the A: drive if it is not. However, there is no provision for booting from the 3½in B: drive, which meant that IBM's OS/2 version could not be booted directly since it was only available in 3½in format.

First impressions are that the System 200 is a noisy machine by current standards, with a positive gale blowing out of the fan in the back of the power supply. Having such a big supply, requiring extra cooling, does have its drawbacks.

**'This is one of the hybrid machines that all the US analysts have been predicting while waiting for the true and legal Micro Channel PS/2 clones to emerge from daring manufacturers like Wyse, and as an OS/2 vehicle the System 200 fits the bill.'**

Opening the case in the normal PC fashion reveals that there is in fact room for three half-height storage devices in the right-hand bay that normally holds the floppy drives, although one of them is not accessible from outside the case. Presumably a hard disk could be fitted in this extra slot, although there is already space for one full-height or two half-height Winchester in the left-hand bay.

The power supply is a hefty Malaysian-built Astec unit, providing a maximum 230W — enough to drive the biggest system configuration with some power to spare. It is worth pointing out that this power supply can deliver nearly four times as much energy as the power supply fitted into the original IBM PC, a development that shows how the PC expansion industry has developed.

The supply has three outlets for drives in the three floppy bays and only one for the hard-disk bay, but splitter cables are readily available if a second hard disk is to be fitted.

At the base of the machine is the new Dell circuit board which forms the basis of the System 200 range. This is a small board, taking up the minimum space inside the machine and filling just half the width of the case. At the rear are six expansion slots, two 8-bit PC types at the left and four 16-bit AT types to the right. As usual in so many machines these days, the 12.5MHz 80286 processor near the centre of the board is surrounded by the Chips & Technologies custom chip set that provides many of the functions of an IBM AT with the minimum chip count, and the 80287 socket — fitted with an 8MHz 80287 co-processor in the review system — is also nearby. The minimum RAM complement is soldered to the board, and comprises 20 256kbit chips and four 64kbit chips for a total capacity of 672k. The minimum user RAM capacity is 640k, the MS-DOS maximum.

The RAM chips are 120ns types, meaning that the 12.5MHz 80286 needs to insert one wait state for each memory access just as the 8MHz 80286 in the IBM AT does. Some clones use faster memory chips or different memory organisations to give zero wait state operation, giving better performance compared with an IBM AT than their raw processor clock speed would indicate. For instance, the AST Premium/286 uses 100ns RAM chips and a direct processor-to-memory link to give zero wait state RAM access to its 10MHz 80286; as a result, the AST machine runs at the same rate as a 12.7MHz AT with one wait state.

It is in the memory area that Dell has made its first bid for the OS/2 market. Next to the soldered RAM is a set of four single-in-line memory module (SIMM) sockets designed to accept strips of eight RAM chips to boost capacity. Using 256kbit chips each SIMM holds 256k, so fitting four of them would take the RAM capacity up to 1.6Mbytes. And, using 1Mbit chips, these four sockets could add a further 4Mbytes of RAM. The extra RAM could be used as pure extended memory for use with Xenix or OS/2, or, with the addition of suitable software drivers, as Lotus-Intel-Microsoft expanded memory, RAM disk, or cache.

Since OS/2 needs at least 1Mbyte to run, and 1.5Mbytes to run using the MS-DOS compatibility box, RAM expansion is vital for machines that will in the end be running OS/2 as their main operating system. And the more RAM the better.

## BENCHTEST

Also on the board are two serial ports, connected to the outside world via two ribbon cables leading to sockets on the back panel, and one parallel port connected in the same way. Since the casing has blanking plates for eight expansion slots, while the System 200 board only has six slots, these sockets have been fitted to plates that fill the two unused slots on the back panel.

The rest of the board has some unusual features. There are two unused soldering positions at the rear, obviously marked and intended for serial-port sockets to be fixed to the edge of the board. The battery that stores the set-up information in CMOS RAM is actually fitted on the circuit board rather than fixed in a separate holder with a cable connection to the board, although there is a connector for such an external battery to be fitted. The main-board battery is socketed, unlike the similar battery on the Apple Macintosh II, and has a claimed life of three to five years. And there is a connector for a floppy-disk drive on the main board, even though in typical system configurations floppy or hard-disk control is handled by a separate expansion board.

One explanation for these features is that Dell may be planning to launch a diskless workstation for network use, with a single floppy drive, no hard disk and limited expansion possibilities. But that must remain in the realms of speculation. Whatever the thinking behind it, the system board is a finished and solid product, with no strange jumper wires or other hardware fixes.

With Dell systems, the peripherals that surround the electronics are chosen by the user at purchase time. With the System 200, however, there is a wider choice than usual. For example, the base machine comes with either a 1.44Mbyte 3½in floppy drive or a 1.2Mbyte 5¼in drive, and there is a choice of hard disks ranging from a slow 20Mbyte drive with 65ms access time to a 150Mbyte drive using an ESDI interface and promising 18ms access.

More significant for OS/2-compatibility watchers is the addition of a VGA graphics board and compatible monitor to the normal choice between monochrome and EGA combinations. There is no news yet of which VGA board Dell will be buying in for use with the System 200, although the EGA board supplied with the review system was built around the Paradise PEGA custom EGA chip, and Paradise is one of the few manufacturers claiming full VGA hardware compatibility using its PVGA1 custom chip.

Going for the Paradise VGA adap-

Notable on the motherboard is the space for four SIMM sockets, and cables which provide an exit for the serial and parallel ports

tor or for one of the other boards claiming register-level compatibility — only Compaq and IBM join Paradise in that claim, in fact — would reassure users that their hybrid PS/2 is as compatible as possible with the original. Although other VGA-compatible boards have been produced by companies like STB, Video Seven, Quadram, Sigma and ATI, these are only 'BIOS-level compatible'; in other words, they will only work with software that uses VGA BIOS routines to display graphics, rather than driving the display hardware directly. And, as with other graphics standards, there is no guarantee that applications developers will follow the BIOS rules in their quest for greater execution and display generation speeds.

On the review system that question was academic. One of the two occupied slots in the machine held a Paradise EGA board, a short 8-bit board built around the big PEGA1A custom chip and fitted with 64k of fast-ish 120ns video RAM. An established standard, and no particular surprises here. The second board was the standard hard and floppy disk controller, built around a Western Digital chip and occupying the 16-bit slot nearest to the disk drives. Again, nothing spectacular and no surprises.

The hard disk was a 40Mbyte half-height unit made by Control Data subsidiary Magnetic Peripherals, with a claimed access time of 28ms. As we shall see, the drive actually performed better than that in use, but 28ms is certainly respectable for a drive that does not use a superfast ESDI controller. It is always worth paying extra — £80 extra in Dell's case, for a 28ms drive rather than a 40ms drive in the same capacity — to get faster disk performance on a fast MS-DOS system.

MS-DOS tends to get disk-bound rather than processor-bound at high processor speeds, and if early reports on OS/2 performance are any guide, disk speed will be even more crucial there. An independent testing company in the US, Neal Nelson & Associates, has published results showing that OS/2 runs up to seven times slower in multi-tasking applications than a popular Unix implementation, the Santa Cruz Operation's SCO Xenix 5.2.2. And the blame for that is placed firmly on the OS/2 disk file structure, which is identical with that of MS-DOS. Commenting on the figures in US news weekly, *InfoWorld*, Russ Kepler, vice president of engineering at Basis Inc, said that 'MS-DOS' has some tremendous failings in the file system, and they are all faithfully repli-

The serial and parallel ports are accessed from two openings which do not link to the six internal expansion slots

cated in OS/2. The file system that MS-DOS uses was designed for 160k floppy disks, but the files that Unix is designed for are the result of about 17 years of tuning and performance enhancements.'

The clear message is that prospective users of OS/2, which has to do a lot of random disk accesses to perform its multi-tasking, would do well to shell out for the fastest hard disk they can afford.

The Dell floppy drives in the review system were conventional units: one a Mitsubishi half-height 5¼in drive storing the usual 1.2Mbytes; and the other an unidentifiable double-sided 3½in drive storing 1.44Mbytes in standard IBM PS/2 format. Just as the 1.2Mbyte drive can read 360k disks, the 1.44Mbyte drive can read 720k disks; but, unlike the 5¼in drive, the 3½in drive can also write 720k disks reliably. These floppy drives were designated A: and B:, with the hard disk partitioned into two 20Mbyte logical drives, C: and D:. It is interesting to note that even OS/2 will not get round the MS-DOS 32Mbyte disk volume limit until the release of the Extended Edition towards the end of this year.

The keyboard supplied was the now-standard Enhanced type, with all the failings and advantages of that design. Interestingly, although the keyboard has the usual Taiwanese shortcomings of short key travel and lack of tactile or audible feedback, it appears to have been built in the Republic of Ireland by an unnamed manufacturer. There is still, despite claims by some manufacturers, nothing to compare with the pleasant feel and positive action of an official IBM keyboard.

One feature that was annoying at

first, thanks to the lack of full documentation, was the loud keyclick sent through the machine's speaker at every key depression. Eventually, trial and error showed that using Ctrl-Alt and the '+' and '-' keys on the numeric pad controlled the keyclick volume to the point of turning it off completely. Similarly, the processor speed can be halved from 12.5MHz to 6.25MHz for compatibility with copy-protected software and older expansion boards, using the 'Ctrl-Alt-#' key combination.

**'... it will do until the real thing — OS/2 — comes along.'**

The monitor too was familiar — a Kaga Taxan 765 EGA screen designed in Japan and built, as is increasing Japanese practice, in Korea. The monitor has a 14in screen, and is actually bulkier than many 14in multi-scan units from companies like NEC and Hitachi, but there is nothing wrong with that. The wide grey bezel round the screen improves contrast and shields the screen from glare and reflections, and the display is clear, rock solid, and sharp. Dell has standardised on Taxans for all its monochrome and colour monitors, including the multi-scan 770+ for the VGA options, and it is a good choice.

And that is it: a proven hardware combination with extra features that should make the System 200 a good vehicle for OS/2 when the official Dell version of that operating system

emerges. The possibilities and difficulties of implementing OS/2 on a machine like the System 200 deserve a separate discussion of their own.

## System software

The System 200 supplied for review came with a copy of MS-DOS 3.3, licensed and shipped by Dell with its own disk labels and manuals. These cosmetic changes seem to be the only ones the company has made, and MS-DOS 3.3 on the System 200 remains the same as MS-DOS 3.3 on any other machine. But the special features of the machine — room for memory expansion, 3½in drives as standard (if optional) fittings, and VGA support — seem to suit it for use as an OS/2 clone.

The word 'seem' is there because there is a lot of confusion about how hardware-specific OS/2 is. Microsoft is saying that OS/2 will never be a consumer product the way MS-DOS is, sold over the counter at the dealer's, since each licensee and OEM will have to tailor the product to match its particular hardware configurations. However, recent reports on the differences between IBM OS/2 and Microsoft OS/2, combined with word from a source close to Microsoft, suggest that the adaptations that OEMs will need to make are few and may not even be necessary in most cases.

Obviously, it is in the OEMs' interests to make sure that any copies of OS/2 sold to users of their machines only come from the manufacturer itself. But against that is the fact that OS/2 has been designed to run on any IBM machine that uses the 80286 or 80386 processor, including the not-much-lamented XT Model 286 as well as the AT line and the

PS/2s, and that includes machines that have monochrome, CGA, and EGA display boards as well as those with the VGA custom chip.

That seems to suggest that any version of OS/2 will run on any clone that can mimic the AT and its video adaptors closely enough, and the current state of the cloning art suggests that most of them will be able to manage the trick. Indeed, sources close to Microsoft say at present, in the absence of any need to support peculiar Micro Channel co-processors and other hardware peculiar to the PS/2, versions of OS/2 from either Microsoft or IBM itself should run unchanged on clones.

Some empirical evidence for that is available. Using the IBM-supplied version of OS/2 from the software developers' kit (admittedly not the IBM release version of Standard Edition 1.0 but regarded even by IBM as essentially 'frozen' code, the operating system was run successfully on the AST Premium/286 at the review site, and did not run on the System 200 only because it did not have enough RAM fitted, with a helpful message on the screen explaining that that was the reason.

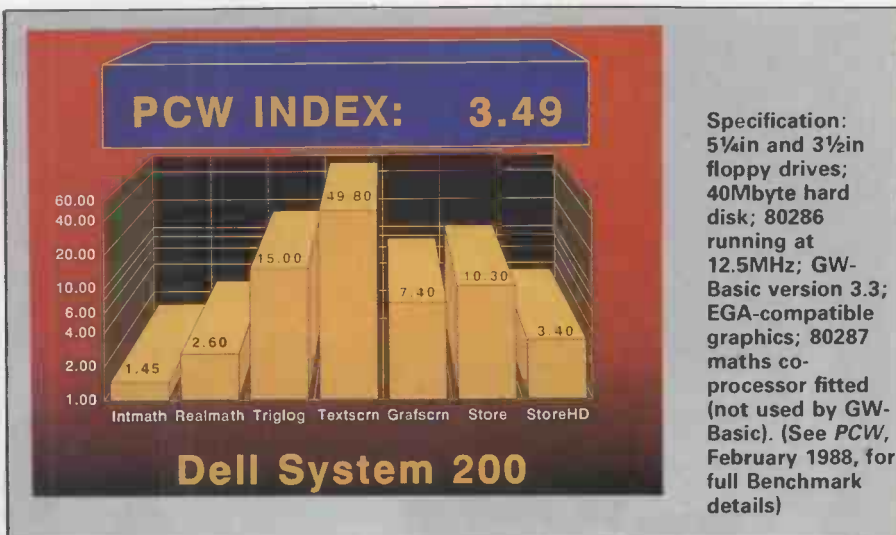

So, there should be no excessive delays among the cloners in getting OS/2 up and shipping on their systems, apart from delays in getting the disk labels and manual binders produced.

However, there are hidden differences between the IBM and Microsoft versions of OS/2 that may have an effect on the porting process, and prevent the IBM versions running on certain clones and with certain expansion boards including internal modems and 80286 and 80386 accelerator boards.

For example, Microsoft OS/2 lets OEMs build in a 'dual-boot' feature, allowing users to keep both OS/2 and MS-DOS on their hard disks and select which one to load at boot time. But this needs to be implemented in the machine's ROM rather than on disk, requiring a system upgrade. One of the early OS/2 suppliers, Zenith, has made this change and offers dual-boot facilities.

Also, IBM has no intention of supporting OS/2 — even on its own PCs — if they have been upgraded with an 80386 accelerator board like Intel's InBoard 386. IBM has stated officially that putting an InBoard into an IBM PC turns the system into an Intel machine rather than an IBM one, and that it is up to the board maker to supply a copy of OS/2 tailored to the new hardware.

And, indeed, Intel has announced that it has licensed OS/2 from Microsoft and will be supplying it for the InBoard, as well as making hardware

**Specification:**  
 5¼in and 3½in floppy drives;  
 40Mbyte hard disk; 80286 running at 12.5MHz; GW-Basic version 3.3; EGA-compatible graphics; 80287 maths co-processor fitted (not used by GW-Basic). (See PCW, February 1988, for full Benchmark details)

changes to the board to get OS/2 to run on its implementation of 80386 logic. Intel says that there will be 'some kind of upgrade path' for existing users to obtain the new hardware, and that future versions of the board will support IBM's version of OS/2 to some extent. However, the company says that it has no policy as yet to support InBoard users who have bought IBM OS/2.

Microsoft, however, says that its version does provide specific support

**'The real interest in the machine is the groundwork it lays for OS/2, with motherboard RAM expansion up to 4.6Mbytes ...'**

for 80386 add-ons. OS/2 uses the special features of the 80386, if one is present, to speed up switching between the protected mode used by OS/2 and the real mode used by the MS-DOS compatibility box. On the 80286 such mode-switching means resetting the processor; on the 80386 it does not. Microsoft's version will allow this mode-switching trick to be used with add-on 80386 boards.

Another fundamental difference is that IBM's OS/2 does not support serial communications using the 8250 chip set, while Microsoft's version of the COMM device driver does. The significance of this is that many internal modems for the PC use the 8250 set, including most of those made by Hayes. The worst of this is that even Hayes doesn't know which of its modems will work with IBM OS/2 and which ones won't; as a general rule, older versions without

custom chip sets have the best chance. Hayes also says that a future internal modem for the Micro Channel will have no problems.

Machines that have non-contiguous memory maps, with non-IBM-standard holes in them (Compaq's DeskPro 386 is a good example) will also fail to work with IBM OS/2 but will work with Microsoft's version. And Microsoft plans to provide a complete set of custom display drivers with the operating system, including support for EGA and VGA boards from companies like STB, AMI, Tseng Lab, Quadram, AST, Tecmar, Paradise, ATI, Genoa, NEC, Video Seven — and Dell Computer's own-brand EG-1000 — while IBM will only support its own graphics standards. Microsoft expects that in the end the add-on board makers will supply their own OS/2 drivers with their boards, which is not unreasonable given that the OS/2 video drivers supplied by Microsoft originally came from the boardmakers.

The other differences between Microsoft and IBM OS/2 are less important. The code that drives the OS/2 Program Selector, the menu-driven front-end normally used to launch applications, is different in the two versions since IBM had to anticipate its Extended Edition while Microsoft did not. But both IBM and Microsoft insist that the Application Program Interface (API) is identical in both versions, so that all applications will work with either. And since the Presentation Manager will work to that API, all Presentation Manager applications will work on both versions, too.

The significance of this for the System 200 is that, at least for now, Dell says that the IBM Standard Edition will work on the machine and any OS/2 application will also run, given enough memory to work with. In the future, though, if internal modems and graphics cards that aren't 100%

# BENCHTEST

compatible with IBM standards are fitted, then users could well find that IBM OS/2 will either fail to work or will work unreliably. Then they will either have to get the official Dell version and use the drivers that will come with the video boards, or forego those expansion boards.

It will be interesting to watch how the hardware and add-on makers come to terms with becoming software suppliers as well — and how IBM AT users will react to being forced to buy a new version of OS/2 when they upgrade their machines with an InBoard/AT.

## Applications software

The EGA-equipped System 200 acts just like what it is — a modern, fast AT-compatible. Everything ran as expected, including Windows 1.04 and 2.03, a very old copy of GEM 1.23, Lotus 1-2-3 Release 2.01, AutoCAD version 2.6, WordStar 2000 Plus Release 3, WordStar Professional Release 4, and any old software lying around including some screen colour utilities that test EGA compatibility by writing to the EGA registers directly. Several packages available on 3½in disk were also tested, including Lotus' new GraphWriter II, Microsoft Word 4.0 and Migent's PageAbility, and again there were no problems or surprises.

To get some idea of how the machine would act with the VGA option fitted, an STB VGA Extra board was plugged in and attached to a Hitachi Multi 560 multi-scan monitor and used to test those packages that had VGA drivers, including Windows 2.03, GraphWriter II, and Word 4.0.

Again, no difficulties, and no sign of the inevitable hardware incompatibility that goes with using a VGA clone board rather than the PS/2 original.

The Dell Support Disk that comes with the system includes the new System Analyser package, a comprehensive 'confidence test' that runs detailed analyses of the system board, disk drives, screen, keyboard, and I/O ports. This is not just a test showing that particular options are present or not, but a full exercising of the system to pinpoint any problems. For example, every cylinder on the hard disk is tested, and the keyboard test requires users to press every key on the board at least once to make sure the whole thing works properly.

Also provided on the disk are a Western Digital low-level hard disk formatter, which can be used to adjust things like sector interleaving, and a head park utility to secure the hard-disk heads when the machine is to be transported.

Interestingly, the Dell System Analyser reacted perfectly to the STB VGA board, as did other non-VGA software tried, using the higher-resolution VGA screen fonts rather than EGA fonts.

Landmark's SPEED.COM program confirmed that the System 200 does indeed run like a 12.5MHz AT with one wait state, around the same rate as a 10MHz zero wait state system and 6.6 times as fast as a 4.77MHz PC. But Core International's disk speed test program showed that Dell has been conservative in rating the Control Data drive at 28ms. The test showed an average access time of

19ms, and the drive turned out to be one of the fastest non-ESDI units around. As we have seen, disk speed will be critical for OS/2 performance, and this drive is as good as you get in a reasonably-priced 40Mbyte package.

The results of the standard PCW Benchmarks are given on page 100 and confirm that the Dell is in the fast AT clone bracket. The PCW research staff will now have to produce a multi-tasking set of OS/2 Benchmarks...

Overall, with the high-quality Taxan screen and a bearable-to-good keyboard, the System 200 is a somewhat noisy but fast pleasure to use.

## Prices

Typical system prices for the System 200 start at £1299 for a monochrome system with either a 5¼in or 3½in floppy drive, a 20Mbyte hard disk, and a monitor; ranging up to £3199 for a system with VGA graphics, a multi-scan monitor, one floppy drive, and a 150Mbyte ESDI hard disk.

Somewhere in the middle is the review system, with the faster of the two 40Mbyte hard disks available, an 8MHz 80287 co-processor, and an extra floppy drive as well as an EGA board and a monitor. The price for that, confirmed by the invoice that Dell helpfully sent, is £2334.

For all these systems, MS-DOS is not included and adds £65 to the price, but the prices do include one year's 'next-day on-site' service from Honeywell Bull engineers, unlimited telephone support on Dell's toll-free 0800 number in the UK, and a limited warranty on parts and labour. Extended warranties are available for up to four years, costing around £100 a year for typical systems.

## Conclusion

As a fast AT clone, the System 200 is by no means earth-shattering in terms of performance, although Dell's distribution methods make it very competitive on price. The real interest in the machine is the groundwork it lays for OS/2, with motherboard RAM expansion up to 4.6Mbytes, a 3½in disk and VGA graphics options, and very fast hard-disk drives.

This is one of the hybrid machines that all the US analysts have been predicting while waiting for the true and legal Micro Channel PS/2 clones to emerge from daring manufacturers like Wyse, and as an OS/2 vehicle the System 200 fits the bill. And, as a VGA-equipped AT clone with a drive that can transfer data to and from portable PCs, running under MS-DOS, it will also do well until the real thing — OS/2 — comes along.

Dell is on (0344) 860456.

END

## In perspective

Dell is not alone in revamping its range with OS/2 in mind. As described earlier, Zenith Data Systems has already produced its version of Microsoft OS/2 for its own fast AT, including the dual-boot ROM feature that is missing from the System 200 and also featuring 3½in drive options. And there is no doubt that other manufacturers will lose no time in launching fast 80286-based machines with big RAM expansion and VGA capability.

But Dell has a reputation for delivering powerful and reliable machines at very low prices, and has support policies that belie its dealer-free approach. Those other manufacturers will get stiff competition from the System 200.

## Technical specifications

Processor:	80286, 12.5MHz
RAM:	640k, expandable to 1.6 or 4.6Mbytes on the main board
Mass storage:	Choice of 1.2Mbyte 5¼in or 1.44Mbyte 3½in floppy drive; 20, 40, 70 or 150Mbyte hard disk drive, with access times between 65ms and 18ms
Display:	Monochrome, EGA or VGA board and matching Taxan mono, colour or multi-scan monitor
Keyboard:	101 keys, Enhanced layout
Expansion:	Four 16-bit, two 8-bit slots; one of each occupied in typical configuration
I/O:	Two 9-pin RS232 serial ports, one 25-pin Centronics parallel port
Operating software:	MS-DOS 3.3 with Phoenix BIOS, OS/2 to come; Dell Support Disk utilities

# Microsoft Bookshelf

A dictionary, a thesaurus, an almanac, a book of quotations, a style guide, a spelling dictionary, a postcode book and a news digest take up a fair amount of space on your bookshelf, so is it worth finding room for Microsoft's CD-ROM Bookshelf instead? David Tebbutt decides.

**M**icrosoft claims that its CD-ROM Bookshelf will make your writing more precise and more interesting. It will do this by giving you instant access to thousands of items of information stored in a set of 10 electronic reference books. The company rather arrogantly claims that this is 'probably the most valuable writing aid you'll ever use.' Or course, that's just hype. There's no way that the very first implementation of a new technology can warrant that sort of claim. Even Lotus 1-2-3 built on what had gone before.

Lots of writers who want to impress their audiences start with a quotation. I'll therefore stick with this tradition and use Bookshelf to see if I can find a good quote which links the subjects of 'writing' and 'interest'. I put the cursor over 'writing', press a couple of keys, add the word 'interest' to a dialogue box, press Enter and up pops:

**Chikamatsu Monzaemon**  
1653-1725

*In writing joruri, one attempts first to describe facts as they really are, but in so doing one writes things which are not true, in the interest of art.*

Chikamatsu Monzaemon  
Preface to  
HOZUMI IKAN, Naniwa Miyage

*Bartlett's Familiar Quotations*  
Copyright (C) 1937, 1948, 1955,  
1965, 1968, 1980 by Little, Brown and  
Company (Inc) All Rights Reserved

The quote is quite useless for my purposes, except to illustrate how easy it is to grab a relevant quote. After finding it and selecting it, I had to quit Bookshelf to reposition my cursor, then call the program up again to paste the quote into the right position.

To run Bookshelf, you need a CD-ROM player capable of understanding the so-called 'High Sierra' format. (Excuse me, while I see if 'High Sierra' is in the Almanac. It's there, but tells you nothing about CD-ROM formats.) The format was agreed between 13 players-to-be in the CD-ROM business. The group included

Philips, Sony, Hitachi, Apple, DEC and Microsoft.

The CD-ROM player supplied for this review was Hitachi's free-standing model CDR 1503S, which will set you back £750. The list price is officially £895, but no one seems to be paying it. Hitachi has two other models, both of which can take the

place of a disk drive in your processor unit. The half-height unit, the CDR 3500, sells for £650 and the full-height one for £450. All units come with audio connections, through either phono or headphone sockets. Sound will come into its own when products appear, such as a dictionary which will not only find the word you're looking for but also tell you how to pronounce it.

The review player measures 12ins by 14ins and is just under three inches high. If you have a conventional three-box desktop, you might find it sits happily between your PC and the monitor. It's certainly strong enough. You would have to be careful not to obstruct the two fairly large ventilation grilles on top, and you will need to leave a disk-sized area free in front for the disk tray to slide in and out.

Bookshelf comes on a single CD-ROM disk and, of the potential capacity of 550Mbytes, only 156Mbytes has been used. You can hold the disk up to the light and see a clear contrast between the reflectiveness of the occupied and unoccupied areas of the disk. Microsoft has packed more than 1000 files on to the Bookshelf disk, including some sales demonstrations for its main product lines. There's also a rather yukky sell for Microsoft itself.

The product is designed as an online aid for any writer, whether they're into business memos, school essays or magazine articles. The present version is targeted at the American market so, unless you are an Americophile, you probably wouldn't find a lot of use for it over here. Still, similar European and British products are under development right now. In fact, Microsoft is the third member of Eikon, a joint venture set up with Olivetti and Seat to develop optical disk software applications for Europe. Eikon will serve as European distributor for Microsoft's CD-ROM division. At the moment Hitachi is doing this job in the UK, more or less as a test marketing exercise.

For this review, I shall try to ignore the fact that the data is American and focus on the potential of this new medium. The present version of Bookshelf costs \$195 and the UK version is likely to be about the same price.

Bookshelf is described as a CD-ROM reference library and comprises the following volumes:

- American Heritage Dictionary*
- Roget II: Electronic Thesaurus*
- 1987 World Almanac and Book of Facts*
- Bartlett's familiar quotations*
- The Chicago manual of style*
- A phonetically-based spelling checker
- Forms, letters and outlines

ZIP codes  
*Houghton Mifflin Usage Alert*  
*Business Information Sources*

It comes with a Microsoft extensions disk which enables DOS to beat the 32 Mbyte barrier and access the huge volume of data contained on the Hitachi CD-ROM drive. It also contains the Bookshelf software which, when transferred to your PC, can be called from inside any application using your preferred hot-keys. Actually, your choices are limited to any combination of the two shifts, Alt and Ctrl, which is pretty mean of Microsoft because they're the ones that need the least programming effort.

As well as the 10 reference works listed on the main menu bar, a further two items offer you help and the

**'The product is inconsistent, especially the intelligence . . . simply to match text strings is not good enough when other applications in the same suite can display so much more native wit.'**

chance to configure the system to your own preferences. The menu bar works in the now traditional fashion, with options selectable by arrow keys or by initial letter, whereupon a pull-down menu appears. Somehow, I'd expected CD-ROM applications to look a lot more exciting than this.

## Installation

The Hitachi player comes with a connecting cable and a PC card. The cable can go either way round and the full-sized card simply pops into a spare slot. I needed to set some DIP switches on my card but I understand these have now been removed. Internal drives are similar except that the connector fits on to the other end of the card. Apart from the fact that the cable is rather shorter than I'd like, because my machine stands under the desk, the physical set-up is very simple.

Or, at least, it would have been had I not had a problem with the Bookshelf disk. The disk, which wasn't new, had a series of hairline cracks radiating from the hub into the encoded section. These cracks were exactly where the boot tracks were, which resulted in read failures whenever I tried to access the disk.

Of course, I suspected my set-up, so I tried the card in different slots, the cable different ways round and in each of the two rear sockets on the Hitachi drive, only to discover that it was a disk problem all along.

The software set-up is a bit of a pain because you have to patch your CONFIG.SYS and AUTOEXEC.BAT files to include some really arcane entries. The last drive needs to be Z, although the Hitachi is drive D: and a DEVICE entry reads: \HITACHI.SYS /D:MSCD001 /N:1. Quite what it all means, I've no idea. But that, coupled with some AUTOEXEC entries and some files you copy into the root directory, eventually give you access to the CD-ROM drive just as if it were a normal drive. This could have been considerably more user-friendly: I hope Microsoft automates the procedure a little more.

When you're on to drive D:, you type 'setup' which transfers programs and data from the CD-ROM into a sub-directory on your hard disk. Once in the hard disk, all that remains is to run the program 'BOOKS'. This loads the resident part of Bookshelf, leaving you to pop it up whenever you like. The hard-disk version of Bookshelf needs 512k memory, the floppy disk version 640k, and a non-resident version will run on a 256k system. All versions of Bookshelf require MS-DOS 3.1 or higher. A mouse is a worthwhile addition but isn't strictly necessary.

The only thing you might then want to do is to change the colours or the hot-keys. The default colours are cyan, black, white, brown and green — and that's it. The entire set-up process could be completed in half an hour or so by someone who's reasonably familiar with computers.

## The dictionary

The dictionary contains over 200,000 definitions, including extensions for people and places. You can access an entry by placing your cursor over the word you seek, activating Bookshelf and then either getting to the dictionary the long way, through menus, or direct with a strange combination of the Alt, Shift and letter D keys.

The entry you need comes up in three colours, with the entries above and below visible at the edges of the screen. If you've misspelled a word, or Bookshelf thinks you might mean something else, a window of alternatives appears so you can choose the entry you really want to see.

I was disappointed that, in the biography section, I couldn't get at Leonardo da Vinci through any part of his name, only the entire entry. Normally, the Biography searches on surname. I don't know if I'm weird or what, but I seem to have struck a

high percentage of anomalies while using this product.

## Thesaurus

The Thesaurus gives access to half a million synonyms and, as far as I can tell, not one of them is rude. Oh, I lie! I did look up 'bedding' quite innocently and discovered that the American synonyms are 'having', 'mating', 'copulating' and you can guess the rest. Anyway, having found a suitable alternative to the word you're employing, you can effect a substitution. (In that sentence, for example, I used the word 'employing' instead of 'using'.)

The blurb suggests that the Thesaurus can offer 'a livelier and more precise alternative'. It's quick, it's simple and I agree, it certainly beats wading through a paper Thesaurus. We're talking about one second to perform a normal search.

## Almanac

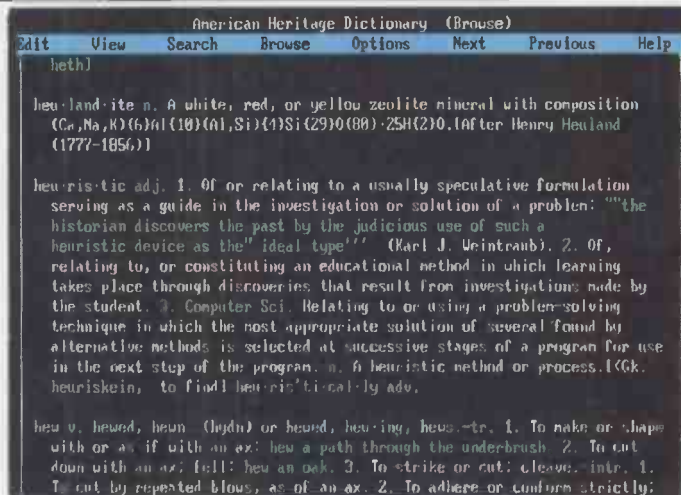

This is the part of Bookshelf I couldn't resist. It contains all sorts of weird and wonderful information. According to the publisher, it contains more than a million facts. You can go straight to the index and browse up and down for something which catches your imagination or you might prefer to go in through the table of contents.

I hit trouble when using the index. I wanted some information on St Lucia, but when I went to the index entry I was routed to the Republic of Rwanda. It's actually two entries away from St Lucia in the Almanac. Tut tut. I also noticed that 'advertising' has been spelled wrongly in the index. You'd have thought that, with all these writing tools available, the publisher would have got its spelling right.

If you prefer a straight search for your chosen subject matter, you can define up to three expressions on which to search. A match on any of the three will make a hit and you will be taken into the first entry which satisfies your criteria. 'Previous' and 'Next' options allow you to roam backwards and forwards through the list of selections.

When you reach an item of interest, you can pan up, down and, if the material on view is wider than your screen, sideways. You can collapse columns to bring those off the screen into view and, like some spreadsheets, you can lock columns in position to prevent them moving off the screen.

When you have the detail you want on display (and this applies to the dictionary, style manual, quotations, business information, forms and letters, too) you can select it with the mouse or Shift-Arrow keys and then copy it into a clipboard for

Unlike the dictionaries included with word processors, the Bookshelf dictionary is complete with full definitions, derivations and pronunciation. Spell-checking can be performed using this version in conjunction with a personal dictionary

later pasting into your document. Each time you do this, Bookshelf kindly appends a copyright notice.

I found that if I went too mad with the copy facility, my word processor (a fully-registered copy of PC-Write) actually choked on the input, effectively hanging my machine. You can copy up to 50 lines at a time from a Bookshelf document, so if you use the 'Append' option, you can build a very large clipboard file. If, like me, you have a periodic 'Save' option which asks for keyboard input by way of confirmation, you are in big trouble.

The paste operation works by kidding your application that the pasted information is coming from the keyboard. I presume that Bookshelf keeps repeating the next character due and, if that's not one which activates your save, you're in trouble. Either make a back-up before pasting large quantities of information, stick to smallish items, or use the 'Save Clipboard' option and import the saved file.

Given the intelligence of the spelling checker, which I'll come to in a minute, I'm astonished at the imbecility of the Almanac searching mechanism. It simply matches text strings. If you don't match, hard cheese. I tried to find Ricky Nelson (a pop singer when I were a lad) — I drew a blank. Since he later changed his name to Rick Nelson, I tried that and got: 'Rick Nelson: "Hello Mary Lou"', 'a song made when he called himself Ricky. Hmmm.

## Quotations

Ah, yes. This was the very first thing I tried. A quote which has appealed to me ever since I worked in technical support is: 'It is well-known that among the blind, the one-eyed man is king.' Erasmus said that, so I tried to find it. No luck. I was quite disappointed until I remembered that this was an American publication and it did, after all, contain 22,500

other quotations, which is a fair number by anyone's reckoning. The Bible's there, so is Shakespeare, so it can't be all bad.

While I was rummaging through the quotations, the pulchritudinous Martin Banks telephoned me. (I was going to say 'lovely' but the Thesaurus offered that irresistible gem.) I thought I'd look up a quote which suited us writers. It came up with: 'A writer is like a bean plant — he has his little day, and then gets stringy.' We both put the phone down feeling quite deflated. Before hanging up, though Martin made the important observation that, unlike a book of quotations which usually relies on your knowing the first line, this approach lets you find an apt quotation regardless of where the keywords appear. He's right, of course.

You can search the quotations by words and phrases, by author, by table of contents or by index. Once again, it beats the socks off using a paper book of quotations; and, even if I search on a common biblical term like 'thy', material appears on the screen in less than eight seconds.

## Style manual

The search engine for the style manual is the same as that used in the quotations and almanac functions. It means you can find information on any aspect of producing a book, from its structure to how to use apostrophies properly. This electronic book is a mine of useful information and, like the others on this disk, lends itself well to the Bookshelf treatment.

## Spelling checker

This checker is similar to many I've seen on PCs. (I looked up the use of apostrophies in the style manual for that sentence.) It checks the spelling of a single word or the entire screen. You may either replace all occurrences of a misspelled word or judge

# Dealer's Choice

*One manufacturer in Taiwan truly offers superior quality and design at a low cost. In a crowded market, its products stand out as a great choice.*

**BOOTH F64/1 HALL 6**  
**CeBIT'88**  
 EXHIBITION MARCH 16-23

**Superset-80**

- Up to 5 Mb memory
- Supports Novell Network, Xenix, OS/2

There's a company who is winning rave reviews for its exceptional products, documentation and customer service; a rare combination for an overseas source. The company is Twinhead International Corp.

Twinhead is engineering oriented, offering customers customized products using their in-house designed ASIC technology. In addition to excellent design, quality manufacturing and components are found

on every product. And, the latest HP automatic test equipment inspects final products.

They were the first company in Taiwan to offer a VGA card and they supply a full line of adaptor cards and systems.

Even if you already are sourcing overseas, this company is worth looking into. They provide outstanding dealer support. Call for their company brochure or visit them in hall 6, booth

F64/1 at the Hannover show.

# SCREENTEST

each one you reach on its own merits. You may ignore case, and you may elect for the checker to detect all words accidentally repeated.

The checker works on both a phonetic and a string-matching basis. 'Reeding' produced 'reading', 'feeding' and 'needing' as alternatives. I don't consider this checker to be particularly fast. It took about 11 seconds on my pretty snappy 80286 to check a 150-word screen. In constant use this would drive me barmy, but if your spelling's not up to much, it must be an attractive program.

## Forms, letters and outlines

If you're the sort of person who needs a bit of a nudge to get going, then 'forms, letters and outlines' are for you. These are a whole pile — around 200k's-worth — of standard letters, agendas, form layouts and the like. Bookshelf contains nine copies of these, to suit the requirements of different word processors. Having found a document you like the look of, a 'Transfer' option bolts it straight into your word processor text.

The nine formats are straight ASCII, Displaywrite, MultiMate, PC-Write, Volkswriter, Word, WordPerfect, WordStar and Xywrite. It was interesting to see how much space had to be allocated to the same file for the different word processors. I was amazed to see that WordPerfect's file was slightly smaller than straight ASCII — it was 186,157 bytes. The same file in MultiMate was 390,144 and, in Displaywrite, it was a huge 606,720. I can only guess that this huge overhead must result in a much more graphically sophisticated display.

Anyone who wonders if they have enough insurance would find the 'household inventory' useful. It takes you round the house, room by room, suggesting all the things you might have in each. Boxes are provided to let you fill in the date purchased, quantity, cost and present value. That's where I was when I looked up 'bedding' and received the astonishing response. I also learnt that it is common for American households to have a mangle in the basement. Once again, the search arguments have to be precise.

## ZIP codes

Just before Christmas, I must have spent an hour looking for the ZIP code of a friend in America. Bookshelf would have found it in seconds. The program automatically checks the address, providing you are very careful how you type it into your word processor. The entire street and apartment number details must

**Trivial Pursuit fans will have hours of fun using the Bookshelf Almanac. Up to three keywords can be combined when searching for references in the text. Over 1000 pages of text plus an index occupy less than one fifth of the disk capacity**

appear on one line, while the town and state have to be on the line below with a single space following the town name. Leave the cursor after the state name or code, so that the ZIP code can be inserted into your document. Here's an example that worked:

Mickey Mouse  
209 Lakeview Drive  
Apartment B3  
Redwood City, California

Bookshelf pasted in an accurate '94062' in six seconds. I tried non-existent addresses in the same street and Bookshelf knew that the house numbers were out of range. The California ZIP code file takes just over half a megabyte, New York state takes over 2Mbytes, while poor old Guam rates just 29k.

## Usage alert

If you have a word you're not sure about — a lot of people confuse 'stationery' and 'stationary', for example — simply position the cursor on the word you've chosen, go into 'Usage', and you will see the similar words and a quick reminder of their meanings. The two I chose were described as 'paper' and 'unmoving'.

You can check the entire screen and, every time a word is in doubt, you are given the option to replace it or leave it alone. The problem is that Bookshelf hangs on to its own dialogue box display and doesn't let you see where in the text the word lies. Once you've accepted or rejected a word, the dialogue box clears and you can actually see the word being replaced in your document. By then, though, it's too late if you've made the wrong choice. It will also waste time replacing a word in your text even when you've selected the same spelling.

It's a pity that such an advanced medium has been let down by such sloppy programming.

## Business information sources

If you have a business problem — maybe it's staff motivation or where and how to raise money — this part of Bookshelf will help you home in on the right sources of advice. All the information sources are described in some detail, so you can make a fairly good judgement of where to go for that missing information.

The *Financial Times*, *The Economist* and *Euromoney* were in there, but no *Personal Computer World*.

## Documentation

The *User's Guide* is a work of art. It's printed on good-quality paper, is 65 pages long, and is filled with jazzy graphics. It looks wonderful but it's not actually that good. It gets you going, though. The accompanying *Quick Reference Guide* — 21 pages of approximately A5 size — is just that, a quick reference. I felt that a real reference section in the *User's Guide* was desperately needed.

## Conclusion

This is just the first step on a long road. The potential of this medium is huge for any kind of information which needs to be accessed in fairly small chunks. At £1000 for a complete system you would have to be pretty serious about needing information on tap like this; but, as the range of CD-ROM reference disks grows and the cost of players drops, I can see this becoming a very attractive way of accessing information.

Bookshelf is a worthwhile first product but it is definitely ragged around the edges. The product is inconsistent, especially the intelligence of the various sections. Simply to match text strings is not good enough when other applications in the same suite can display so much more native wit.

Hitachi is on (01) 848 8787.

# PC/AT toolboxes

Just how much room is there in the portable PC market? Peter Jackson examines three more contenders, from NEC, Sharp and Walters — power computing in a 'lunchbox'.

**T**he launch of the Compaq Portable III two years ago legitimized a brand new segment of the portable computing market, offering a compromise between the battery-powered laptop with limited functions and storage and the full-featured portable that was really just a desktop PC in a different external package.

The Portable III made no performance compromises, and was at launch the fastest machine that Compaq had on its books. It came with a standard 5¼in floppy drive and a fast high-capacity hard disk, with an optional box that could hold standard AT-style expansion cards, and could only run on mains power. But it used a flat-panel plasma screen rather than a CRT to save space and weight, making it possible to fit everything into a smaller external casing that has been described as a 'lunchbox' or 'toolbox' form factor.

Naturally, once a successful new market segment had been defined, everybody else thought of it as well. And the three machines discussed here are simply three of the latest in the rush embodying the different pricing levels involved. However, all of them have one feature in common. They are all around 10lbs lighter than a traditional PC-compatible portable, and around 10lbs heavier than a PC-compatible laptop.

## NEC PowerMate Portable

Japan's NEC, now the biggest chip maker in the world, has never made much of a splash in the computer business. After getting off to a bad start with the CP/M-based PC8001 in the early days, it has produced a

series of adequate but unexciting machines under the Advanced Personal Computer (APC) label. Now, with the APC IV PowerMate range, NEC seems to have got serious. The PowerMates are top-end AT-compatibles at competitive prices, and the PowerMate Portable is simply one of the line.

Externally, the Portable looks too big for a lunchbox — it is around the same size and shape as a small-footprint AT like the Tandon Targa stood on end, with a hefty solid metal carrying handle at the top. The reason for the extra height is soon apparent; removing a panel from the top of the machine reveals two full-length AT-compatible expansion slots, one short AT slot, and one short 8-bit PC slot. Expansion boards plug in vertically, running across the full width of the machine.

That extra height may make the machine harder to carry, but the decision to include slots also gave NEC some design opportunities. Operating a simple catch releases the detachable keyboard that forms the whole front surface of the case, and reveals a display that uses the full height of the front panel to offer a nearly-square 9in LCD screen. The screen angle can be adjusted at will, but the PowerMate uses nothing so flashy as the Compaq Portable III's 'garage-door' cantilever hinge. Instead, the screen is hinged at the top, allowing the bottom to be pulled out of the case. There are no ratchets, and friction alone is used to hold the screen at the desired angle.

The only other features on the front panel are three indicator lights to show when mains power is on, when the hard disk is being accessed,

From left to right: the Walters LCD Portable, the NEC PowerMate Portable and the Sharp PC-7200

and when the processor is running at its fastest 10MHz speed, along with a simple knurled wheel to adjust the LCD contrast.

Looking around the rest of the machine, it is easy to overlook the disk drives altogether since NEC has chosen to buck the Portable III and use 3½in drives. More, it is using the smallest drives possible, both, naturally enough, built by NEC itself. The 720k floppy is just 20mm high and no wider than the disk slot, while the 40Mbyte hard disk is the same width and less than twice the height. Against the overall size of the machine, they look insignificant.

The drives are at the right-hand end of the case, next to a conventional PC keyboard socket for those who prefer a full-scale Enhanced layout. And the only other feature at

this end is a bewildering array of DIP switches, three eight-way and one four-way, along with a simple toggle switch to select CGA or EGA emulation on the LCD screen.

The back panel is completely blank, and all the other external connectors are at the left-hand end. These comprise a 25-pin parallel port, a nine-pin RS232 serial port, an IBM-standard RGB connector to drive an external CGA or EGA monitor, and a 36-pin connector for an external floppy drive — presumably a 5¼in drive for program and data transfer purposes. Next to these are the three blanking plates for the expansion card connectors, normally hidden behind a snap-off panel, the cooling fan, and the mains input socket.

Internally, the design is simple and conventional. All the computer electronics are built onto a single PCB covering the entire area of the back panel, with a single large expansion

socket that connects to an expansion daughterboard. This daughterboard mounts at right angles to the main PCB and holds the expansion slots. As mentioned earlier, there are four such slots. Two are conventional full-length ones, while the other two are packed closely together, end-to-end. One of these, the 16-bit short slot, has no access to the outside world at all and normally holds the hard disk controller, while the other will only take a short 8-bit card such as a second serial port.

The main PCB is built around a 10MHz 80286 processor, surrounded by the now-standard group of eight Chips and Technologies custom circuits. The RAM on the board is oddly divided into three separate blocks, one containing 18 256kbit chips and six 64kbit chips, another with eight 64kbit chips, and the third with four more 64kbit chips. However that memory is split between the LCD screen and user RAM, there is the

usual 640k of RAM reported by the power-on self-test routines.

Also included on the board are an 80287 maths co-processor socket, four ROMs holding the various Phoenix IBM-compatible BIOS routines, a Western Digital floppy disk controller, and the control logic for the LCD screen.

As you might expect from a major company like NEC, the board is a clean and solid piece of work with no odd jumper wires or other kludges. But it will be a configuration nightmare for users and dealers; besides the four DIP switch blocks accessible on the outside of the case, the PCB holds an astonishing five more eight-way DIP switches.

The keyboard will cause similar confusion for users. Although it is much deeper than a conventional PC keyboard thanks to the extra height of the machine, it still has the typical laptop problem of cramming everything into a limited width. NEC has

# BENCHTEST

got round this by moving one entire block into a very odd position indeed, directly above the numeric keypad. This block consists of the four separate cursor keys found between the QWERTY and numeric pads on normal Enhanced layout keyboards, and the NumLock, PrtScr, Scroll Lock, and Pause function keys.

This is only one of NEC's departures from the new Enhanced standard. The alternative set of editing keys, including Home, End, Insert, Delete, and PgUp and PgDn, is missing completely, as are the grey Enter and slash ('/') keys from the numeric pad. The left shift key has been extended, and the backslash ('\') key moved from next to the 'Z' key to a position above a reduced-size Enter key. However, there are the expected 12 function keys, and Escape is still in its odd position at the top left-hand corner.

## In use

Powering-on the machine produces the familiar noise of any AT, a combination of fan and hard disk drive. Indeed, the PowerMate Portable was noticeably noisier than the AST AT clone sitting next to it at the review site.

The LCD display is very reminiscent of that supplied with the Zenith Z-181 laptop, with a blue surround and a blue on yellowish-grey text display which is clear and sharp thanks both to the backlighting and to the EGA compatibility of the screen. This compatibility was tested with a copy of Microsoft Word 4.0 on 3½in disk, which successfully produced a 43-line display on the LCD just as it does on a conventional EGA CRT.

The display was considerably slower than an EGA CRT however, with letters seeming to seep onto the screen as keys were pressed rather than pop up sharply. This can be irritating and distracting when the screen is used for long periods, and is inferior to the fast, glowing amber-on-black display of plasma panels. But the large, square LCD is superior in its turn to the squatter screens found on the Compaq Portable III and on other lunchbox or laptop machines.

The keyboard is excellent in feel, and NEC seems to have got closer than most to the clackety sound and tactile feedback of the IBM original. Compared to the spongy feel of many clone keyboards, both portable and desktop, it is a refreshing change.

The system software provided is MS-DOS 3.2 rather than the newer MS-DOS 3.3, and the compatibility software comes from BIOS specialist Phoenix Technologies. There are a

The keyboard takes up an unusual amount of desk space. The cursor key cluster sits in a curious position above the numeric keypad

few quirks and additions; holding down a key while the machine is booting bypasses the memory testing routines, and three extra software utilities are provided specifically for the Portable. TURBO sets the processor speed to its top 10MHz rate; while TURBOFF sets it to 8MHz, and RETRACT retracts the heads on the hard disk to protect both them and the drive when the machine is to be moved.

Otherwise, everything worked as expected. The use of 3½in drives limited the amount of software that could be tried on the machine, but both Microsoft's Word 4.0 and Migent's PageAbility worked with no problems.

The same could not be said of the copy of Xerox's Ventura Publisher supplied on the review machine's hard disk, since the batch file that was supposed to start it did nothing of the kind and we could discover no other way of getting it going. But there is no reason to doubt that NEC and Phoenix have made the PowerMate Portable as compatible as any other AT.

One drawback was the inability to switch processor speeds from inside applications using the keyboard; the only way to do it was to quit back to the MS-DOS prompt and run TURBO or TURBOFF. Of course, these commands can be included in batch files used to start up recalcitrant programs or copy-protected ones in slow 8MHz mode, and then go back up to 10MHz after they have finished. But this method does not allow copy-protected programs, say, to be loaded in slow mode and then actually run in fast mode.

Four blanking plates can be seen, but the NEC uses three expansion cards

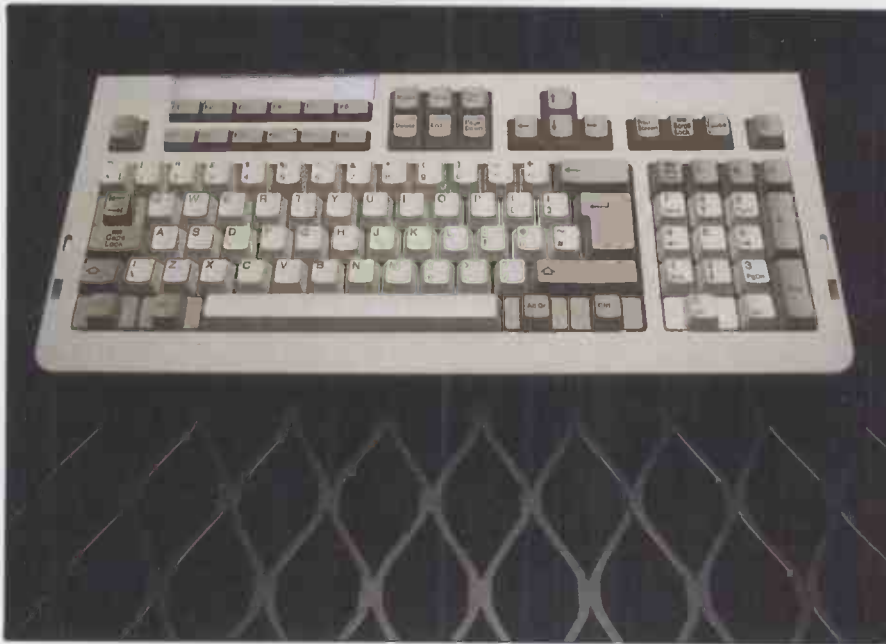

## Sharp PC-7200

Saying that Compaq legitimised the lunchbox portable may be true, but it is a little unfair to Sharp. The original PC-7000 had many of the features that the Portable III brought to market, such as a flat panel display, 5¼in drives and mains-only operation, and lacked only fast AT compatibility. That has been put right in the PC-7200.

Externally, the PC-7200 has more of the toolbox look to it, a small suitcase-style handle on top of a mainly featureless grey block. As usual the keyboard is clipped onto the front of the case, and removing this reveals a rather odd front panel. The LCD screen is wide and low above a hefty base, and next to it is a set of controls that look more like

# BENCHTEST

The Sharp PC-7200 keyboard has the IBM Enhanced layout but in a much-altered design; the most significant difference being the re-positioned function keys

The Sharp has 25-pin RS232, Centronics printer and CGA graphics ports

something off a MIDI hi-fi system rather than a computer. At the top are four indicator lights: one showing when the screen is in standby mode, one indicating mains power, and one each for the internal floppy and hard disks. Below these are two sliders like volume controls which handle the contrast and brightness settings for the backlit LCD. And then comes a switch that can change the LCD between standard and reverse 'video', and the button marked 'tilt' releases the screen catch and allows its angle to be adjusted.

The hefty base of the machine is there for the same reason as the extra height of the PowerMate Portable: to let users add standard expansion boards. In the Sharp's case, just one board can be fitted in the base of the machine, running flat across the full width of the bottom of the case. Getting access to the slot involves removing the base panel, revealing an odd AT-compatible 16-bit socket. The 8-bit part of the sock-

et is fixed to a circuit board, but the 16-bit extension is a socket on the end of an unfixed ribbon cable. Fitting a 16-bit board into this combination could be a tricky job, given the wobbliness of this cable.

The disk drives, this time conventional 5¼in units, are at the right-hand end of the case and comprise a 1.2Mbyte floppy and a 20Mbyte third-height Winchester. Also at this end is the keyboard socket, using a US-type phone jack. Oddly, if the keyboard cable is left connected when the machine is closed up for carrying, it dangles out loosely; for safety, and to prevent catching the cable on passing objects, users need to remember to disconnect it from both keyboard and machine, and store it in a special compartment provided in the base.

The rest of the major connectors and controls are on the back panel this time. The obvious ones are 25-pin serial and parallel ports, and a nine-pin socket for connection to an external colour or monochrome monitor. This socket can be connected either to an IBM-compatible CGA monitor or to a standard monochrome monitor, since interfaces for both are provided. Less obvious are two small press-out panels to the left, designed for use when an optional internal modem is fitted.

Also on the back panel are controls to set the type of external monitor connected, change the processor speed — a choice of 6, 8, or 10MHz, switch between the different LCD modes and select CRT operation, and alter the speaker column. The only other external connector is a Sharp specific expansion slot hidden be-

hind a metal plate in the base of the machine. This is an external expansion box that will accept two more full-length 16-bit cards, one full-length 8-bit card, and one short 8-bit card.

The internal electronics are very different from the conventional combination of standard components and Chips and Technologies custom circuits found in the NEC machine. The main circuit board makes extensive use of Sharp-labelled custom chips and surface-mounting techniques to cut down the board area, and as a result the board looks simple and uncluttered. The 10MHz 80286 is actually built by Advanced Micro Devices, and sits next to an empty 80287 socket. The standard 640k RAM is made up of 512k using 256kbit chips in the ever more common space-saving single-in-line packaging, and 128k in more conventional 64kbit chips. Memory can be expanded by plugging eight 1Mbit RAM chips into the empty sockets provided, taking total RAM capacity up to 1.6Mbytes for use with Xenix or, these days, with OS/2.

The connectors for the AT expansion slot and the expansion box are all along one edge of the board, with the modem socket on another edge, and the other interfaces come out vertically from the surface of the board. A second, inaccessible board, mounted back to back with the main PCB, controls the hard disk.

Again, unlike the NEC board, and typical of machines making heavy use of custom circuitry, the Sharp board is covered with engineering fixes including many small soldered-on wires and diodes attached across chip pins — evidence that the board has not yet been fully debugged.

Preparing the machine for action, it is interesting to note how Sharp has approached the same keyboard problem that NEC faced. Given the lower height of the PC-7200 the keyboard is smaller and lighter than NEC's, and has less space available for the Enhanced keyboard layout that is demanded these days. Sharp has decided to implement all the Enhanced keys, and even add one new key of its own (of which more later), by putting all the control keys above the QWERTY and numeric key areas. As a result, the inverted-T of cursor keys is above Backspace, the duplicate set of six editing keys (Home, End, PgUp and so on) is to the left of that, and the 12 function keys, much reduced in size, are arranged in two rows of six and use small push-buttons rather than full keycaps.

## In use

The first noticeable thing about the PC-7200 is that it is extremely quiet,

## BENCHTEST

so that you have to press your ear to the case to hear anything at all. This is despite the fan and hard disk, and was particularly noticeable while the NEC PowerMate or the AT clone were running nearby.

The LCD display is similar to that on the NEC machine, with the same blue backlighting and a greyish screen background with dark blue text. This time the dotted nature of the text was more evident, thanks to the limited cell size of the character set used in both monochrome or CGA emulation. As with other laptops and portables the display aspect ratio is around 3:1, and this makes it hard to believe that there actually are 25 lines displayed on the screen until you type them in and count them. This is particularly noticeable when running graphics programs in CGA mode, with the clock in Microsoft Windows, say, looking so distorted that it is not easy to read.

The LCD screen has only three possible positions, set by a ratchet controlled by the front-panel push-button, and the brightness and contrast controls give only minimal change between illegible darkness and illegible white-out. But there were no problems in obtaining a readable display in various lighting conditions, thanks to the backlighting and the non-reflecting surface of the display.

Using the oddly-laid-out keyboard was surprisingly easy, even in programs like WordPerfect where heavy use is made of the function keys. In most Enhanced keyboards on desktop machines, the function keys are in any case too far above the top row of the QWERTY section for easy touch-typing use, and if you have to look at the keyboard to hit one, you might as well look at two rows of push-buttons rather than one row of conventional keys.

The major problem, however, was the cursor key pad, which is too far away from other keys and in a non-intuitive position. Most users except the most number-intensive will want to boot up with NumLock off, and use the cursor keys on the numeric pad instead.

Sharp provides no special utilities with the machine, although some of the features often provided in software are implemented in hardware instead. For example, it is possible to switch processor speeds in the middle of a program simply by sliding the back-panel switch from its normal 10MHz setting to 8MHz or 6MHz, with no interruptions. And you can also switch between the LCD and CRT displays at any time with another back-panel switch.

The mode of the LCD display can be changed by a third switch, but

The Walters LCD Portable keyboard conforms almost exactly to the original IBM PC/AT layout. Consequently, there is no separate cursor key cluster

this must be matched with the setting stored in CMOS RAM. To do this, Sharp has provided a special SetUp key at the top right of the keyboard, which calls up the configuration program. In fact, this is nothing special; all it does is run a setup utility program, and can only be called up from the MS-DOS prompt and not from applications. It is debatable whether using this key is any better than typing SETUP at the prompt, and it must be put down to gimmickry. The setup program itself lets users set the usual AT options, but at least does it in a menu-driven and easy-to-understand way.

If you can live with the squashed-up LCD screen and CGA resolution, then the Sharp is a neat machine with no compatibility problems that we could find. The only slight hiccup was that the monochrome and CGA displays look identical in text mode, and it is easy to forget which is currently set. But a flick of the mode switch solved that problem, and the machine ran graphics-intensive programs like Windows with no problems. As with the NEC, that is what you expect from a reputable maker using a Phoenix BIOS.

### Walters LCD Portable

Walters has one of the widest ranges of cheap PC compatibles around, and the LCD Portable is simply one in that range. And the machine has more in common with the rest of the Walters range than the NEC or Sharp ones do with their respective ranges. In fact, the LCD Portable is built around a standard desktop PC motherboard, albeit a small one, with pretty much standard features and

The Walters' two ports are on expansion cards. The video card is CGA

pretty much standard expansion boards plugged into it to give the portable its special features.

As a result of using this design, the LCD Portable is larger than the Sharp, which it outwardly resembles. In particular, the casing is much deeper to accommodate the thickness of the keyboard, the LCD screen, and then the height of a normal AT-type expansion card.

Removing the keyboard by pressing two spring-loaded buttons on top of the case reveals an uncluttered front panel with another long and low LCD screen. Three lights indicate the usual motherboard features, including a real-time battery-backed clock and calendar and various timers and interrupt controllers.

Walters has avoided the portable Enhanced keyboard problem by ignoring it. Although the LCD Portable keyboard has 12 function keys across the top of the board, the rest of it has a normal AT layout with Ctrl

IF YOU WORK WITH COMPUTERS, YOU'LL BE AWARE OF RAPID ADVANCES IN GRAPHICS SOFTWARE. YOU'LL ALSO KNOW OF THE CONSEQUENCES. NEW STANDARDS NEED NEW HARDWARE TO BENEFIT FROM THEM. AND NEW HARDWARE IS OFTEN UNABLE TO SUPPORT THE OLD STANDARDS. WHICH MEANS THAT THE MONITOR YOU BUY TODAY MAY BE UNABLE TO RUN THE SOFTWARE YOU USED YESTERDAY. WORSE STILL, IT MAY BE INCAPABLE OF ADAPTING TO THE GRAPHICS STANDARDS OF TOMORROW. IT'S A PROBLEM. BUT NOW THERE'S A SIMPLE SOLUTION. TAXAN'S NEW MULTIVISION

## TAXAN'S NEW MULTIVISION 770 PLUS IS ONLY COMPATIBLE WITH 3 GRAPHICS STANDARDS.

770 PLUS COLOUR MONITOR. MULTIVISION 770 PLUS WILL ADAPT TO ANY HORIZONTAL SCANNING FREQUENCY BETWEEN 15 AND 35KHz. WHICH MEANS IT WILL SUPPORT ALL MAJOR GRAPHICS STANDARDS. WHAT'S MORE, YOU'LL FIND THAT YOUR PICTURE SIZE REMAINS CONSTANT AS YOU SWITCH BETWEEN THE VARIOUS GRAPHICS STANDARDS - A FEATURE OF THE 770 PLUS UNMATCHED BY THE COMPETITION. TO COMPLEMENT THE MONITOR, TAXAN HAVE

DEVELOPED THE 565 AUTO EGA-480 DISPLAY ADAPTER. THIS VERSATILE CARD ENABLES THE MULTIVISION 770 PLUS TO SUPPORT HERCULES™, IBM™ MONOCHROME, CGA, EGA AND OUR NEW 640 x 480 AND 132 COLUMN TEXT MODES. THE MULTIVISION 770 PLUS IS, THEN, MORE THAN CAPABLE OF SUPPORTING THE STANDARDS OF BOTH THE PAST AND PRESENT. BUT WHAT ABOUT THE FUTURE? WELL, THE 770 PLUS IS PERHAPS THE FIRST TRUE MULTIPLE SCAN MONITOR. IT CAN ADAPT TO ANY VERTICAL SCANNING FREQUENCY BETWEEN 50 AND 90 KHz. WHICH MEANS THAT, IN ADDITION TO SUPPORTING THE VERY LATEST DISPLAY STANDARDS OF THE IBM PERSONAL SYSTEM/2™ AND THE APPLE MACINTOSH II™, IT SHOULD EVEN BE ABLE TO SUPPORT THOSE THAT HAVE YET TO BE INVENTED. SO, WHEN THE TIME COMES TO UPDATE YOUR MONITOR, LOOK INTO TAXAN'S MULTIVISION 770 PLUS. YOU'LL FIND THAT THE PAST, PRESENT, AND FUTURE LOOK EXTREMELY BRIGHT.

**TAXAN**  
A KAGA COMPANY  
PERFECTING THE IMAGE

TO FIND OUT MORE ABOUT THE TAXAN RANGE OF PRODUCTS, CALL US ON 0344 484646.

next to A, a large Enter key, and a numeric pad that doubles as a cursor control and editing pad. The separate cursor and editing key groups of standard Enhanced keyboards are missing altogether, but Walters does at least use a standard keyboard connector so that larger Enhanced keyboards can be plugged in.

## In use

The Walters machine is also quiet, despite the fan and the 40Mbyte hard disk fitted in the review system. The LCD screen is again a blue-backlit model, but is noticeably inferior to those fitted on the Sharp and NEC machines. The contrast is lower, the background colour is muddier, there is some shimmer like that seen on CRTs close to unshielded power supplies, and there are distracting vertical bars on the background whenever text of any kind is displayed. This last defect is particularly noticeable when the display is completely filled with text, which also shows up the cramped nature of the long and low screen when the full 25 lines are used. The friction hinge on the display is also not particularly effective and it is easy to dislodge the screen by nudging it.

The keyboard is also a good example of the cheap clone kind, with more key travel than usual and a

reasonable feel. The AT keyboard layout is a refreshing change after the infelicities of the so-called 'Enhanced' design.

The Walters' Seagate drive comes with Seagate's own Disk Manager partitioning and diagnostic software, developed by Ontrack Systems. This gives users control over the way the hard disk is configured and provides information on defects and faults, as well as offering a head-parking utility that is recommended for use whenever the machine is used. Also supplied with the machine is a set of utilities to manage the interface of the Hercules emulator and Basic programs, although these are not necessary for everyday use of the emulation. Otherwise, the system software is standard MS-DOS 3.21, running on top of an Award BIOS. Award is Phoenix's major competitor, and has an equally high reputation for compatibility.

The CPU speed can be switched from 10MHz to 6MHz either by flicking a switch on the side of the machine or by typing Ctrl-Alt-+ to toggle between the speeds. This can be done at any time inside an application or out, and was shown to best effect by running Landmark's SPEED test program. With the machine in 6MHz mode, SPEED showed it running at exactly 6MHz,

or three times the speed of a 4.77MHz PC; flicking the switch instantly changed the display to show 12MHz and 6.3 times PC speed. The extra 2MHz is due to the zero-wait-state RAM used on the motherboard, since SPEED assumes that there is one memory wait state when it makes its comparisons. In everyday use, the Walters LCD Portable runs like a 12MHz AT with one wait state, rather than a 10MHz one with zero wait states.

Again, as expected, there were no compatibility problems with the machine. Interestingly, the LCD controller board drives both CGA and monochrome Hercules displays externally, but only emulates CGA on the LCD. The particular monitor connected, and the LCD display mode, are set by a DIP switch on the display controller board, and there is also a two-way switch that can be used to reverse-out the LCD screen if required. In one of the modes, the LCD can use patterns to emulate colours in CGA, but the user is advised to find out what these look like by trial and error.

The only problem found with the machine concerned the floppy disk drive. Apart from the physical problem, which was that the floppy was positioned behind the hard disk drive and was hard to get at from the front of the machine, the drive produced 'general failure' messages at one point with both 1.2Mbyte and 360k disks. A reboot fixed the problem, which then did not reappear.

## Conclusion

Compaq's Portable III and Portable 386 are obviously designed as machines that will be used on desks most of the time, and transported rarely; the availability of a bolt-on expansion box and tape streamer show that. And who would want to carry a 20MHz 80386 with a 100Mbyte hard disk to and from work every day? The competition — and the three machines here qualify — are competing on price and extra functions, as usual. But it remains to be seen whether the portable mains-powered PC market is as strong as Compaq and the rest think it is — or whether the small number of managers who need such a machine have already been satisfied by Compaq's glossy offering. NEC, Sharp and Walters are hoping that saturation point has not been reached.

The NEC PowerMate Portable costs US\$3995. Details from NEC on (01) 993 8111. At the time of going to press the UK price was not available. The Sharp PC-7200 costs £2700 from Sharp on (061) 205 2333. The Walters LCD Portable costs £1733 from Walters on (0494) 32751. All prices exclude VAT.

END

## Technical specifications

### NEC PowerMate Portable

Processor:	80286, 8MHz or 10MHz switchable
RAM:	640k
Mass storage:	720k 3½in floppy, 40Mbyte hard disk
Display:	Backlit supertwist LCD, 80×25 or 80×text, CGA and EGA graphics emulation
Keyboard:	93 keys, modified Enhanced layout
Expansion:	Two long 16-bit slots, one short 8-bit slot in hard disk configuration
I/O:	External floppy disk and monitor ports, RGB monitor port, serial and Centronics ports
Operating system:	MS-DOS 3.2, Phoenix BIOS

### Sharp PC-7200

Processor:	80286, 6, 8, 10MHz switchable
RAM:	640k expandable to 1.6Mbytes
Mass storage:	1.2Mbyte 5¼in floppy drive, 20Mbyte hard disk
Display:	Backlit supertwist LCD, 80×25 text and 640×200 CGA graphics
Keyboard:	103 keys, modified Enhanced layout
Expansion:	One long 16-bit slot, one Sharp slot for expansion box
I/O:	External RGB monitor port, 25-pin Centronics and serial ports
Operating system:	MS-DOS 3.2, Phoenix BIOS

### Walters LCD Portable

Processor:	80286, 6MHz or 10MHz
RAM:	1Mbyte
Mass storage:	1.2Mbyte floppy disk drive, 20Mbyte or 40Mbyte hard disk
Display:	Backlit supertwist LCD, 80×25 text and 640×200 CGA graphics; external CGA or Hercules monitor supported
Keyboard:	86 keys, AT layout with 12 function keys
Expansion:	Four free 16-bit slots; two almost inaccessible
I/O:	External monitor port, then this is the preferable one of the three

# A NEW KIND OF COMPUTER TO REVOLUTIONISE THE WAY YOU WORK

The Z88 is a new kind of computer.

A computer that's the size of an A4 pad, weighs a couple of pounds, and drops into your briefcase with plenty of room to spare.

A computer which can provide up to 3 Mbytes of memory ... which works on four AA batteries ... which comes with a complete suite of powerful, user-friendly software built in.

A computer which puts your files, your calendar, your diary, and the contents of your desktop at your fingertips ...

A computer that gives you *all* the capability of a desktop unit, in a package that dramatically increases its convenience.

All for just £249.99 + VAT!

All the RAM you'll ever need ...

The Z88 has 32K RAM built in, expandable immediately to 416K

(enough for around 80 typed A4 pages), and soon to 3 Mbytes - providing more power than most desktops. Expansion RAM is

in 32K or 128K solid-state packs (½ Mbyte and 1 Mbyte packs soon). Forget cumbersome disk drives, forget fragile disks!

And all the ROM you can put in your pocket! Like RAM, EPROM (Erasable Programmable Read-Only Memory) comes on 32K or 128K slot-in packs. With 1 Mbyte packs coming soon, you could put the complete works of Shakespeare on three packs and drop them in your pocket. Compare *that* with the paraphernalia of floppies!

AVAILABLE FROM LEADING ELECTRICAL AND COMPUTER STORES, ALLDERS, COMET, COMET AT DEBENHAMS, DIXONS, HARRODS, SELFRIDGES.

Data in. Data out. Directly ...

The Z88's resident software formats data for interchange with IBM-compatible micros. Transfer

data back and forth between your desktop PC and the Z88, using the Z88's PCLINK -

which also converts resident Z88 software files into either Wordstar or Lotus 1-2-3 files. A BBCLINK for BBC micros is also available.

Or over the phone!

The Z88's optional modem means you can send or receive data from another Z88 or an IBM-compatible over the phone.

Download your day's work and clear your RAM ... pick up tomorrow's programme and save it ... all you need is a phone socket and a modem.

Printing without problems

The Z88 drives virtually any printer - serial or parallel - directly through either of the Z88's printer cables.

20 hours computing on four AA batteries

Advanced technology slashes power consumption - and combines with a bright, crisp, 8-line by 80-character supertwist LCD display to give you at least 20 hours of full-facility computing.

Make time spent travelling work for you ...

Everything you need for 20 hours' live computing is packed within the body of your Z88. Less than an inch slim, less than the size of an A4 pad, it

simply slips into your briefcase. And leaves you room for a collapsible umbrella - after all, you won't need files, calculator, note-pad, address book, pens, diary ...

Wherever you are, you're in touch!

From office to home, from home to Helsinki or

Tokyo - you can take *all* your

office facilities with you, checking back and updating daily. Writing your minutes in Birmingham?

Send them by phone to head office for printing and distribution.

Checking appointments made for you? Get them over the phone - direct to your Z88.

As unobtrusive as a pocket calculator

No fuss, no noise ... the Z88 has a 'silent' keyboard, and takes up very little space. Inoffensive on public transport.

unobtrusive in

meetings or

lectures ... and

capable in

every environ-

ment, with its

built-in word-

processor, spreadsheet, database and personal

management software always available.

# Micro Midget

Despite the growing interest in powerful, high-specification micro systems, a home can still be found for a small MS-DOS unit. Martin Wren-Hilton checked the service offered by ACPM'S Micro Midget, a compact, modestly-behaved AT-class system.

A few months ago, IBM announced that it had 'shipped' its millionth Personal System/2 computer. (IBM definition for 'shipped': transferred from manufacturing facility to warehouse, not necessarily delivered to customers.) According to industry estimates, nearly one half of those machines were Model 30s — which shows that for most office and small-business applications, simple MS-DOS workstations are still popular in a world where all the talk is about the 80286 and 80386.

The Micro Midget from ACPM (Associated Computer Product Marketing) is a neat MS-DOS machine aimed at the same market as the PS/2 Model 30, the Amstrad PCs and the like. It is really called the ASI-009 and is manufactured in the States by a company called Aquarius Systems Inc, although it is only available in the UK by mail order from ACPM.

## Hardware

Physically, the system unit is one of the smallest on the market: at 10ins x 10ins x 3ins, I suppose that's why ACPM decided to market the machine as the 'Micro Midget', although the name sounds more like a cartoon character or a small, plastic toy figure.

The heart of the Micro Midget is an Intel 8088 microprocessor which can be clocked at 4.77MHz (like the original IBM PC) or at 10MHz (turbo mode). The basic Micro Midget comes with 256k of RAM, which is barely enough to run most modern application programs. For only slightly more than the base price, ACPM can supply you with 640k (which is what the review machine had).

Setting up the Micro Midget required a bit of fiddling inside the case to set two jumpers and a DIP switch to select the type of monitor attached — Hercules-compatible monochrome TTL or CGA-compatible RGB colour.

Next to the display port on the rear of the machine is a parallel printer port (standard 25-pin D connector) and two serial ports (both with 9-pin D connectors). Providing a full complement of ports as standard obviates the need to buy expensive, space-consuming add-in adaptor boards.

The system unit is attached to the mains by means of a standard IEC power cord (as used on all IBM Personal Computer equipment). A socket above it, on the rear of the machine, provides power to the monitor which saves unnecessary cabling and means that the system (including monitor) can be powered from a single plug.

All the components, including power supply, are on a single PCB

For such a small machine, the Micro Midget is well-equipped with ports

The keyboard supplied was a 101-key keyboard, sometimes known as the 'Enhanced' model, although the standard Micro Midget comes with an 84-key keyboard. For those who have never used either version, the 101-key variety, which was first introduced with the IBM PC XT 'S'-models, is much easier to use than the slightly cramped 84-key unit which used to be the standard for PCs and ATs.

There are 12 function keys across

the top of the keyboard and separate keypads for the cursor control, numeric input and system control functions (Page Up, Home, and so on). At the top right are indicator LEDs for Caps Lock, Number Lock and Scroll Lock. On the review keyboard, which was a US model and did not have a '£' sign, there was an extra 'Macro' key at the bottom left of the keyboard. I could see no use for it, and ACPM knew of none. The lack of a '£' sign was a

# BENCHTEST

The review machine's keyboard was a foreign AT-compatible unit. The final release will have a standard PC keyboard

feature of the review model, according to ACPM, and all models shipped to customers will have English keytops.

The keyboard plugs into the Micro Midget through a DIN connector on the front of the machine. Also on the front, to the right, is the red power switch. The design and location of the power switch resemble the PS/2 family of computers, all of which feature similarly-mounted power switches.

Many personal computers have the monitor power socket on the rear of the machine wired in with the computer's power switch. Not so with the Micro Midget — the display must be switched on separately. Once switched on, a 'power on' LED above the power switch lets you know that the system is running. There is no cooling fan in the case, so you can't 'hear' that it is switched on. After a brief memory test, the Micro Midget boots MS-DOS from drive A:.

Two storage configurations are available: a single 720k 3½in floppy disk drive, or dual drives, which were fitted to the review machine. Due to space limitations, only one expansion slot is available when two floppy drives are installed, whereas the single-drive machine has two full-length expansion slots available.

If you are considering using one of these machines on a network or with

a hard-disk card, it is probably better to have just one floppy disk drive installed for the extra expansion slot you get in compensation. ACPM does not offer any hard-disk options for the Micro Midget. As the use of a drive bay would take up one expansion slot, the best solution would be to use a hard-disk-on-a-card. Because cards are mounted horizontally in the Micro Midget, and to conserve space, the Plus Developments' HardCard would probably be the best choice.

Opening the case is simple — just four screws on the bottom have to be removed in order to slide off the top half. Inside, the miniaturisation and effective use of space become apparent. To the front are two Fujimanufactured one-third height floppy disk drives connected to the mother-

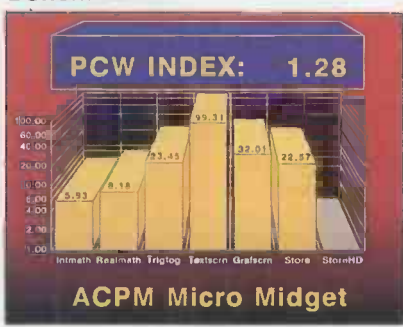

board by a ribbon cable. To the right is a long, thin power supply that extends the full length of the case.

All external ports are connected directly to the motherboard, which integrates the processor, RAM, BIOS, ROM, dual-mode display sub-system, real-time clock with battery back-up, and one or two standard IBM-compatible expansion slots.

Upgrading the memory from 256k to either 512k or 640k merely involves plugging in extra RAM chips and configuring the relevant DIP switches on the motherboard. If you decide to do this yourself, make sure that the RAM has an access time of 120ns (nanoseconds) or less, to cope with the 10MHz clock speed. Further RAM expansion is possible by installing a LIM expanded memory board for those applications which have been designed to make use of it.

Input/output requests from application programs and MS-DOS is handled by 8k of BIOS ROM. Most clones have either Phoenix or Award BIOS, which are the two most well-known. The Micro Midget's BIOS is the ERSO BIOS produced by the Taiwanese Government and includes the ability to toggle the processor speed from 4.77MHz to 10MHz and back by pressing Ctrl-Alt-Minus together. The speed at boot-up can be selected by setting a DIP switch on the motherboard. When in 10MHz mode, the

## Benchmarks

See 'Time trials', PCW, November, page 138

# BENCHTEST

cursor appears as a solid block, and in 4.77MHz mode, it appears as a single line.

Considering its diminutive size, the Micro Midget has only one SMT (Surface Mount Technology) component — a Yamaha 6363 graphics adaptor. This flat-pack chip provides two modes of operation: HGC (Hercules Graphics Card) emulation for use with monochrome displays; and CGA (Colour Graphics Adaptor) emulation for use with colour displays. Switching between the two, as described above, must be done with the power switched off.

Attached to a monochrome monitor, the Micro Midget can display text (80x25) or high-resolution graphics (720x348). With 64k of display memory, two 32k high-resolution images can be stored at once.

The colour display was slightly disappointing. At a time when the MCGA (Multi Colour Graphics Array — 640x480), VGA (Video Graphics Array — 640x480 with more colours) and EGA (Enhanced Graphics Adaptor — 640x350) are becoming established, the decrepit CGA looks ready for the rubbish bin, with its lowly 640x200 graphics mode.

In 640x200 graphics mode, the only 'colours' available are black on white. With a painful 320x200 display, four colours can be squeezed out, but the rules that govern which

four colours you can use are complicated. The Yamaha 6363 carries emulation too far, in my opinion. It even produces a slow, flickering display when text scrolls in the CGA mode, just like the old IBM adaptor.

By comparison, the MCGA chip set in the IBM PS/2 Model 30 has the same amount of display memory (64k) but produces a far sharper and more colourful display, although the analogue monitors required are slightly more expensive. Fortunately, the Micro Midget accepts plug-in display adaptors, unlike some clones (notably the Amstrad PC1512) which does not. By changing two jumpers inside the machine, the graphics subsystem can be completely disabled, which I would recommend if you want a colour display.

Also on the motherboard is a real-time clock powered by a rechargeable battery, and a socket for an optional 8087 mathematics co-processor: unfortunately, the socket is hidden under a disk drive which would have to be removed if you wanted to install one. Certain applications, most notably CAD packages like AutoCAD, speed up quite dramatically when a co-processor is installed.

## Software

You will need MD-DOS to operate the Micro Midget, although it is listed

as a separate item in the ACPM price list. The version the company supplies is 3.21, which supports 3½in disks. Also available from ACPM is DOS Plus from Digital Research.

For compatibility, I tried a number of well-known applications including Microsoft Works and WordPerfect Executive, which ran without a hitch. However, whenever I ran GW-Basic, the machine switched to 4.77MHz mode, so the PCW Benchmarks are slow.

## Documentation

The review machine was supplied with a preliminary manual, although the contents and presentation were very good. Apart from an unnecessarily long discussion of the keyboard, there was a lot of useful and interesting facts with clear diagrams. The version of MS-DOS that I was provided with was also preliminary, so I didn't receive any documentation for that. It is most likely, however, that ACPM will supply Microsoft's own OEM material, as supplied with many clones.

## Price

The Micro Midget with a single drive and 256k costs £290. For a 640k system, add another £59. A second 3½in disk drive costs £79, and Microsoft MS-DOS 3.21, £50. A 12in TTL monochrome monitor will set you back £105, a 14in RGB colour display, £265. Total system price, as reviewed, excluding monitor, is £478. (All prices exclude VAT and carriage.)

## Conclusion

Probably the most important aspect to consider when purchasing a personal computer is the after-sales service. Obviously, buying from a mail-order company does not bring the advantages that you would expect when buying from a dealer. But, there again, you probably won't find a machine quite like this at your local dealer.

The service offered by ACPM was exceptionally good. The first machine I received had a faulty video chip; ACPM provided a replacement the following day. Perhaps that's because I was reviewing the machine for PCW! To be fair, though, ACPM was very helpful and efficient in all respects.

Although the base price seems low at £290 (excluding VAT), things start adding up when you consider the 'extras' (display, MS-DOS, and so on). If your requirements are for a small-footprint, simple MS-DOS workstation, the Micro Midget is a competent performer that, unlike most AT-class machines, leaves most of your desk free.

## In perspective

At £290, ACPM's little Micro Midget may seem deceptively cheap. By the time a second 3½in disk drive is added, plus the cost of MS-DOS, and a colour monitor, and the RAM upgrade to 640k, the total looks more like £743 (plus VAT).

There are four big markets for small MS-DOS boxes like the Micro Midget — the home, education, lightweight business applications and, perhaps the most common, network terminals accessing a central file server. These markets are both highly competitive and price sensitive.

ACPM sells by mail order and has been trading since April 1987. Repairs can only be performed once the faulty machine has been returned to the company; nonetheless, buyers seriously concerned about maintenance will probably buy a maintenance contract anyway.

The three real strengths of the Micro Midget are that it is really small, has a full complement of ports as standard, and the base model is cheap. If you can get hold of a cheap monochrome monitor and can get by with 256k and a single disk drive, then £290 is a hard price to beat.

Apart from the Amstrad, another machine which closely resembles the Micro Midget — at least in terms of its specification — is the Zenith eaZy PC. (See Benchtest, PCW, November 1987.) It, too, features 3½in disk drives, a small footprint and noiseless (fanless) operation. Where the Zenith scores highly is with its pin-sharp white-on-black monitor. However, it has little expansion potential (no industry-standard expansion slots) and, at a base price of £499, costs slightly more than the Micro Midget.

## Technical specifications

Processor:	Intel 8088-1 running at 4.77/10MHz
Co-processor:	Optional Intel 8087
RAM:	256k, expandable to 640k
ROM:	8k ERSO BIOS, expandable to 32k
Mass storage:	One 720k 3½in disk drive
Keyboard:	84 keys comprising 10 function keys, 57 alphanumeric keys and 17 keypad key
Monitor:	Optional TTL monochrome or RGB colour
Display modes:	Monochrome text mode (9x14 pixels giving 720x350 resolution, two intensities); monochrome graphics mode (720x348, Hercules)

# Canon BJ-130

If you're looking for impressive, laser-like printer output without the cost and irritating noise, the BJ-130's clever use of bubble jet technology could be ideal. Simon Jones was impressed with its high-quality output and its quiet operation.

**T**he Canon BJ-130 Bubble Jet Printer is a remarkable machine giving laser printer quality for the price of a good 24-pin dot matrix. The basic technology is not new. Printers that fire jets of ink onto the paper have been around for a few years, but this is the first one to give such high-quality output.

In this review, however, as well as considering the quality, I was looking

for ease of use, useful features, speed, and how easy the printer is to set up, all from the point of view of a person who uses a PC for business. To carry out the review I used a Blue Chip PC — an IBM PC compatible — running WordPerfect 4.2.

To show how good the image from a BJ-130 is, compare it with an ordinary impact dot matrix printer. On a 9-pin printer the pins are arranged in

one column of nine. A 24-pin printer has two columns of 12 pins each in the same space, which gives a much better quality output. The BJ-130 has one column of 48 nozzles giving print of such high quality that it is almost indistinguishable from that of a daisy wheel printer. The highest graphics resolution obtainable on the BJ-130 is an impressive 360 dots per inch: most laser printers under £4000 can

Unfortunately, bubble jet technology is no better at printing solid black than most dot matrix printers suffering the same characteristic 'streaky' grey lines

can manage only 300 dpi.

Most ink-jet printers use piezoelectric crystals to squirt the ink onto the paper. These crystals expand and contract when an electric current is applied to them, and this movement is used to squeeze ink onto the paper. Unfortunately, the crystals have to be a reasonable size in order to do their job. This limits the size of the print head and the packing density of the print nozzles.

However, a happy accident in Canon's Japanese laboratory in 1979 showed a way to create a print head with no moving parts.

The BJ-130 is called a bubble jet printer because bubbles of ink vapour are used to force liquid ink out of the print head. Each of the 48 nozzles has a heating element built into the nozzle wall. When the element is turned on, the ink touching it boils momentarily, making bubbles. These bubbles force a drop of ink to be fired out of the open end of the nozzle. The heating element is then turned off and the surrounding ink cools the vapour in the bubble, making it collapse, drawing fresh ink into the nozzle. As the print head moves across the paper, the heating elements are fired in sequence to form the letters or graphics required.

The bubble jet print head is cheap and simple to make as it has no moving parts. This also means that it can be smaller, giving more closely-packed nozzles and better print quality. One of its biggest advantages is that it is very quiet. The only noise it makes is the movement of the paper and the print head.

There is one distinct disadvantage, though: you cannot produce carbon copies or use NCR paper. If you need two or three copies of a document, you must either print it once and photocopy it or print it two or three times. Luckily, the BJ-130 is quite quick: Canon quotes 110 cps in High Quality (HQ) mode and 220 cps in High Speed (HS) mode.

The BJ-130 is a wide-carriage printer taking paper up to 16 inches wide. It comes with a cut-sheet feeder as standard; tractor feed is an optional extra.

Having a wide carriage means that this printer can take A4 paper both lengthways and sideways. The sheet-fed hopper can take about 100 sheets of 80 grams per square inch (gsm) paper. Ordinary photocopying paper works fine. The manual recommends using plain bond paper of between 52 and 81 gsm, which may lead you to think that using thicker paper or paper with a fancy surface may cause problems. In fact, I had no trouble at all using 100 gsm laid paper. (Laid paper has a rough surface and is often used for letterhead

notepaper for business.)

One font, Courier, is supplied as standard and there are two slots for optional font cartridges under a flap on the front. I was supplied with three font cartridges to try: Orator, Gothic and Gothic Outline. Although there are only two slots, you can have three extra fonts in the machine at once. There is a simple way to copy one font cartridge into the printer's RAM and then replace that cartridge with another one, thus giving you four different fonts to work with. The printer's RAM is volatile, however, and will lose its contents when the printer is switched off.

All fonts can be printed at 10, 12 and 17 cpi and can be proportionally spaced. You cannot use the term NLQ (Near Letter Quality) to describe the output of this printer because even when it prints at its fastest speed, it produces perfectly-formed letters. The only difference between HQ and HS modes is that the print is darker in HQ mode. There is no special draft-quality font. The high speed option merely prints characters as an 18x48 matrix rather than the high-quality 36x48 matrix. This is done by moving the print head twice as fast across the paper and printing only every other column of dots. Both fonts and pitches (character counts) can be selected from the control panel, as can other features.

The control panel consists of seven 'buttons' and 14 LED indicators (the buttons are really just coloured areas on the smooth plastic surface). The switch mechanisms are underneath and give a little click when you press the buttons. One of the buttons is marked SHIFT and this changes the function of the other buttons. Thus the MODE button, which switches between HS and HQ modes, becomes, when the SHIFT button is on, the FONT button and chooses between the built-in font, the two font cartridge slots and the font RAM.

The REVERSE button makes the printer print white letters on a black background, and the SHADING button gives a pale grey wash under the letters. Both these facilities can, however, leave plain white spaces between the lines of print. This can be cured by printing at eight lines per inch rather than the more usual six, or by enclosing the print in box characters.

The EXPAND button allows you to expand the print to two, four or six times its original size, horizontally and vertically (that is, four, 16 or 36 times the area). The characters are still made from a 36x48 matrix so expanding them to more than twice their size does tend to show jagged edges. However, that apart, it is still a useful facility for producing signs

Courier 10cpi x2  
 abcdefghijklmnopqrstuv  
 ABCDEFGHIJKLMNOPQRSTUVWXYZ  
 1234567890~#!"{\$%^&\*()

Courier 10c

 Courier

Using the expand button or escape codes it is possible to increase the size of type by two, four or six times. However, no attempt is made to smooth curves

### Speed Test Results

Test	HS10	HQ10
Text	0:40	0:54
Text Bold	0:44	0:58
Text Underlined	1:15	1:44
Standard Letter	0:31	0:39
Boxes	1:34	1:55

Note that each of these pages was printed separately, which meant that the print head had to be uncapped for each page. If you were printing a continuous run of pages, the times would be two seconds faster for each page except the first. However, the sheet feeder also takes time to line up the pages — approximately seven seconds per page. This would be avoided if the optional tractor were used. (Sheet feed times are not included in the table above.)

For details of these speed tests, see the article on 24-pin printers in the March 1987 issue of PCW.

and large labels quickly and cheaply.

There is a button marked CLEANING which will remove paper particles and dust which may have accumulated on the print head. You need to use this feature only if the printout has missing dots or the printer hasn't been used for some time.

There are LED indicators for most things on the control panel, including INK. One ink cartridge should last for about one million characters of HQ print — approximately 800 pages.

Once the INK indicator lights up, you can only print about 10 lines more before you have to change the cartridge. Changing the cartridge is a very simple job, much easier than changing a ribbon on a daisywheel or dot matrix printer. But, clearly, it always pays to have a spare cartridge handy. They cost around £12.

Setting up the printer is quite simple. You clip one plastic panel into place to form a paper rest for the sheet feeder, two metal guards clip

onto the front for some unknown, possibly decorative, purpose, and that's it. Loading paper is simply a matter of putting some in the sheet-feed hopper. The ink cartridge and font cartridges slide easily into place and the parallel interface cable plugs in the back.

Unfortunately, Canon UK could not supply me with the DIP switch setting information. There are two banks of 10 DIP switches under the front flap, which control the default settings for MODE and FONT, paper length, and so on. This vital information will be contained in the manual when the printer becomes available.

Many word-processing packages now have drivers for 24-pin printers and, as this printer emulates a 24-pin printer, you should be able to get it to work with your WP package without too much difficulty. I use Word-Perfect for all my word processing, and it incorporates a utility which allows you to create your own printer driver routines as well as modify existing printer drivers.

To use the PRINTER utility you must have full details of the control codes the printer responds to. As the manuals for the BJ-130 were not ready when I was testing the printer, I could not construct a full printer driver for it. It did respond to the driver routine for the IBM Quietwriter but, as the Quietwriter has only one font, I was restricted in the number

Most routine operations such as changing ink cartridges, setting the DIP switches and installing new fonts can be accessed via a fold-down panel

of facilities I could use. Canon says that the BJ-130 will emulate an IBM Proprinter and an NEC Pinwriter if you set the DIP switches correctly.

The Canon BJ-130 is completely silent when idle, and is so quiet in use that when I first used it I thought there was something wrong with it. Canon quotes the noise level as being under 48dBa, roughly half as loud as a conventional dot matrix printer. There is a quiet whine as the print head moves across the paper and small clunks as the paper moves through the printer. When you first

turn the printer on, when software sends it a reset code, or, about 20 seconds after it has finished printing, the printer makes a strange whirring noise. This is the sound of the print head being capped or uncapped. The print head must be kept capped when it's not in use.

The print head lives, when it's not printing, hidden away at the left-hand side of the printer and, unlike impact dot matrix printers, there is no flap or cover giving easy access to it. This is not, however, a problem as there is no ribbon to change.

## Documentation

The lack of a finished manual caused some problems when I was trying to write this review, but, from what I did see of it, it is fairly well-written with clear explanations and diagrams. It comes in two parts. The first part is a *User Guide* which contains details of setting up and operation, including how to load the paper and change the ink. The second part is the *Programmer's Guide* which lists all the control codes, and is vital to those who need to write their own printer driver routines. The *Programmer's Guide* wasn't available at the time of writing, but if it's as clear as the *User Guide*, it should be OK.

## Conclusion

All in all I was impressed with the Canon BJ-130. It is a nice machine to work with and blissfully quiet — and should be available by the time you read this (other bubble jet printers follow later in the year).

If you can forgive the lack of carbon copies, it is a good machine for those who want high-quality printing at a reasonable price. It is certainly cheaper than a laser printer, faster than a daisywheel and quieter than a dot matrix. I'd buy one.

Canon is on (01) 773 3173.

# Waiting for a miracle

IBM's much-heralded OS/2 brings with it a sophisticated multitasking system and many enhancements — for the professional, it's certainly an improvement on PC-DOS. But beware of the wolf in sheep's clothing. Dick Pountain tackled it head-on.

As I begin this review of IBM's new operating system, I can't help but notice in the morning paper that Samuel Beckett's play, *Waiting for Godot*, has been revived at the National Theatre. The temptation to draw a parallel between the dramatic plight of the play's main characters, Estragon and Vladimir, and that of IBM's PC customers is almost irresistible, but fortunately I have resisted it; I won't even point out the fact that Estragon and Vladimir are usually depicted in Charlie Chaplin-style tramp costumes.

IBM has sown more than its usual crop of fear, uncertainty and doubt with the introduction of OS/2. Ostensibly we are offered a new operating system standard, perhaps to last us for the next decade, which remedies many of the deficiencies of PC-DOS. OS/2 is truly multitasking, allowing us to perform several jobs at once, and it can address up to 16Mbytes of memory instead of the claustrophobic 640k of PC-DOS.

But then come the doubts. OS/2 can run the old PC-DOS software (in a special mode), but any future software which exploits its advanced features will not run under PC-DOS. Software developers must choose now — DOS or OS/2. OS/2 is not multi-user, so business users looking for cheaper solutions are still left with a choice from Pick, Unix, BOS or CDOS. OS/2 will not run at all on 8088 or 8086-based machines; you need an AT or better and your old PC must go in the bin.

But what to upgrade to? Any 80286 machine should run OS/2 (provided it has at least 2Mbytes of memory), but 80286 machines are already obsolete since the introduction of the immensely superior 80386 chip. So go for an 80386 machine, then? Fine, but the version of OS/2 featured here has been written for the 80286 and will not support any of the smarter

features of the 80386; that version is one or two years away, depending upon who you talk to. Waiting seems to be the name of the game.

The version of OS/2 reviewed here is the very first commercial release, 1.0, of the Standard Edition. This is a text-based version of the operating system, with a menu-driven user interface that resembles a simplified form of the ill-fated Topview. Next year we shall see version 1.1 which includes the Presentation Manager, a Windows-like graphical user interface. 'Standard Edition' distinguishes it from the Extended Edition which will have built-in database management and communications compatible with IBM mainframe operating systems.

I tested OS/2 on an IBM PS/2 Model 80 loaned by IBM UK, which is an 80386-based machine though it currently runs OS/2 in the 16-bit protected mode, pretending to be a fast 80286.

## Installation

I was supplied with OS/2 ready installed on the Model 80's hard disk, but I checked out the installation procedure as a matter of interest. OS/2 is supplied on four of the PS/2's 1.44Mbyte, 3½in diskettes. The first three disks contain the operating system itself and its external commands and utilities, which number 112 files and over 1.6Mbytes of code. The fourth disk is the installation disk and contains 53 files adding up to 869k. As you will quickly grasp, we are talking about a large system here.

OS/2 is installed by booting the fourth disk which takes you through an interactive installation program. This starts by formatting a partition on the hard disk (if required), and then prompts for the other three disks followed by various options such as the national character set and keyboard, type of mouse, and

the configuration. The configuration means the contents of the 'CONFIG.SYS' file, which is generated by the installation program automatically. At a later date you can alter the configuration by merely editing CONFIG.SYS, just as you would in DOS. Despite the size and complexity of the system, IBM has made this initial installation procedure very straightforward and more or less foolproof.

CONFIG.SYS is recognisably descended from its DOS equivalent, in that it contains a number of single-line statements such as DEVICE=xxxx, which loads a device driver at system boot time. However, it has grown much more complex than its DOS predecessor. In addition

to the familiar DEVICE and BUFFERS statements, there are a number of new ones, from the obvious DISK-CACHE to the less obvious MAX-WAIT, PRIORITY, SWAPPATH, MEMMAN, PROTECTONLY, THREADS and TRACE. These control aspects of multitasking and memory management. To set sensible values for these parameters you clearly need to know a lot about OS/2, and the installation program offers a set of default values which will get you running. For the record, the basic CONFIG.SYS generated by my system contained 23 lines.

The PROTECTONLY statement is interesting, as it governs the modes which the CPU is allowed to run in. If

you specify PROTECTONLY=YES, then the 80286/386 will only be run in protected mode and can only run pukka OS/2 programs. If, on the other hand, you specify NO, then the CPU can be switched to real mode (in which it emulates an 8086) and this permits DOS programs to be run as well, using OS/2's 'compatibility box' (of which more later).

The only OS/2 programs I was supplied with were BASCOM, C and COBOL compilers, and MASM, so the use of DOS mode was absolutely essential to preserve my sanity. I was able to install SideKick and use this to edit system files, in preference to the supplied EDLIN line editor; both only work under DOS mode. This

raises a tricky point which is anticipated in the *User's Reference Manual*. If you set PROTECTONLY=YES in CONFIG.SYS then you cannot run DOS programs, but since no OS/2 editor is supplied you cannot edit CONFIG.SYS back again, and you are locked out. Renaming CONFIG.SYS and rebooting is the only way out, for then OS/2 cannot find a configuration and sets the default, PROTECTONLY=NO. The fact that IBM is still shipping EDLIN as the sole system editor in 1988 is profoundly depressing, but fortunately I remain too speechless to utter a serious libel.

OS/2 can use more disk space than DOS can, but still only in 32Mbyte

chunks. If your hard disk is bigger than 32Mbytes, then you need to use FDISK to set up a primary partition, from which OS/2 boots, and a number of extended partitions which are treated as separate logical drives D:, E:, and so on.

## The Program Selector

When OS/2 has been installed and configured, booting it leads you into a screen called the Program Selector. This is the main control panel of the operating system, from which you can run programs directly or create a new command prompt. You can return to the Program Selector at any time, from inside whatever program is running, by pressing Ctrl-Esc, which acts like the 'hot-key' that pops up a TSR like SideKick.

The Program Selector screen contains two boxes, side by side, occupying most of the screen. The left-hand box is called 'Start a Program', and it contains a menu of programs which can be run merely by selecting them with the highlighted bar cursor. When first booted, the only programs that are present on the 'Start' menu are the OS/2 Command Prompt and a graphics demonstration program called Introducing OS/2. Extra programs can be installed by using the 'Update' menu, which pops down from the top of the screen when you either press F10 or point with the mouse. A form is presented into which you enter the required menu title of the program, its full pathname, and any command line parameters it needs.

When a program has been started by selecting it from the Start menu, its name appears in the right-hand box, which is called 'Switch to a Running Program'. Because OS/2 is multitasking, there can be many programs in this box at the same time; selecting one puts you back into that program and gives it control of the screen. The OS/2 prompt itself is a program (the command interpreter, called CMD.EXE) and so you can run multiple copies of this, too. From a prompt you can run other programs as usual by typing their names.

To summarise, then, you can run a program either by installing it on the Start menu and selecting it, or by starting a command prompt and typing its name: IBM calls this process starting a new 'session'. Once it has started, pressing Ctrl-Esc returns you to the Program Selector and you can run another program. All the other programs continue to run with full rights, except that you can't see them on the screen; they are not suspended as is the case with TSR programs like SideKick, or with all GEM applications.

There is at present no way of

allowing multiple tasks to share the screen. This will come with OS/2 version 1.1 and the Presentation Manager, which will let each task have its own overlapping window on the screen.

To revisit a running program, you can select its name from the right-hand 'Running' menu, whereupon it returns to the screen instantly. There is also a short-cut to visit another session without going through the Program Selector screen; pressing Alt-Esc cycles you through all the sessions currently running one after another. Like Ctrl-Esc, this is a hot-key which works from inside any application.

The DOS emulation works rather differently. If DOS is enabled (PROTECTONLY=NO), it appears in the Program Selector's right-hand box as an already-running program called 'DOS Command Prompt'. This program cannot be stopped, and you cannot start further copies of it since it does not appear on the Start menu. This reflects the way that OS/2 handles DOS emulation; it reserves a 640k 'box' at the bottom of memory for DOS programs alone and will not release any more memory to DOS. In contrast, OS/2 tasks run above the 1Mbyte mark, and you can run as many as there is memory for (subject to certain limits on threads, see below).

The DOS prompt behaves just like PC-DOS 3.3, complete with all its utilities and even its own AUTOEXEC.BAT that is executed when you first select it, rather than at boot time. However, when you switch away from the DOS box to an OS/2 screen, the DOS application is suspended and does *not* continue to run in the background.

Due to the new OS/2 disk format, the range of software that I could try was limited; but most things I tried worked perfectly, including PC-Write, PC-Tools, SideKick and Notebook.

Not all old DOS software works, and you are advised to try any application that you *must* carry over to OS/2 before purchase.

OS/2 boasts more extensive online help facilities and better error reporting than PC-DOS (which is not too difficult to achieve). A strip across the top of the screen called the 'Help line' can be enabled or disabled by the HELP ON and HELP OFF commands. When you are at the OS/2 prompt, for instance, it reminds you of the use of Ctrl-Esc. In the Program Selector it offers both the Update menu and several Help screens which are accessed by pressing F1. One irksome omission is some visual indicator to identify which session you are in; other multitask operating systems like Digital Research's CDOS put a number in the prompt. When you have several sessions open, you can soon forget where you are.

The OS/2 command line error messages are more verbose than those in PC-DOS, and also clearer; however, I am not sure that OS/2's 'SYS 1041: The name specified is not recognised as an internal or external command, operable program or batch file' is any less irritating than good old 'Bad command or file name'. Any error message in OS/2 can be expanded still further by typing 'HELP <error number>', whereupon two paragraphs are displayed describing the *explanation* of the cause of the error, and the *action* to be taken.

Despite these effusive messages, there are still a few little horrors in store. When you install the COM2.SYS device driver to run the mouse, a message politely informs you that the 'COM2 port did not install' and 'device adaptor could not be found'; this signifies that all is well because the mouse has grabbed the COM2 port. Perhaps, on reflection, there is a certain Beckettian logic to this.

## New commands

The command interpreter of OS/2 version 1.0 has been designed to be very familiar to PC-DOS 3.3 users, so many of the commands are identical in both name and action. You type 'DIR' to see a directory listing, 'TYPE' to view the contents of a text file, 'CD' to change directory, 'DEL' to delete files and 'COPY' to copy them. There are, however, a number of new commands that relate to multi-tasking and fault tracing, which I shall briefly describe here.

Perhaps the two most important of the new commands are 'START' and 'DETACH'. START <name> starts up a new task called <name>, as if you had selected it from the Program Selector. It creates a new session and command interpreter for the task, different from the one from which START is executed; to start a task in the current session, you need only type its name.

If this sounds obscure, consider a batch file containing the following instructions:

```
START TOM
START DICK
HARRY
```

When you run this batch file, it will run TOM and DICK in two new sessions, and run HARRY in the current session: that is, it leaves you in HARRY. To see TOM and DICK running, you would need to press Alt-Esc twice. START can execute batch files as well as programs.

DETACH performs a similar role for non-interactive programs — that is, programs which do not perform any keyboard or screen I/O. It does not create a new command interpreter for its task, but runs in pure background mode. Obviously, such a task needs to do some kind of I/O (unless it is a transcendental meditation task) and this has to be provided by redirection to files. For example, if you have a program called LOGGER which reads in data from an instrument, you can run it in the background with output to a file by typing 'DETACH >MONDAY.DAT LOGGER 2>&1'. >MONDAY.DAT redirects standard output to file MONDAY.DAT, while the 2>&1 redirects the standard error channel to the same file; otherwise, any error messages would attempt to go to the display.

OS/2 contains some sophisticated error tracing features resembling those of a minicomputer, and which become necessary with operating systems this large and complex. 'TRACE' permits selective tracing of system events (such as disk reads and writes, or starting new sessions). Major system events are assigned event codes between 0 and 255, and TRACE ON 23,45 would instruct OS/2

to record the time of occurrence of all events of types 23 and 45. The *User Manual* doesn't include the event codes, which are to be obtained from 'your IBM service representative'.

'TRACE ON' with no parameters traces all events, while 'TRACE OFF' can disable tracing of all or some events. The trace data is stored in a memory buffer whose size is set by the 'TRACEBUF' command, but defaults to 4k. Both commands may also be included in a CONFIG.SYS to enable tracing from boot-up.

To see the trace, you have to issue a 'TRACEFMT' command which formats the buffer contents and sends

**'SPOOL is the program that manages the queue for the printer. Various tasks may all print at the same time, each thinking that it has the printer to itself. In fact, SPOOL catches the outputs, separates them, and stores them ...'**

them to the standard output, which you can redirect to the printer or a file. Then 'your IBM service representative' can use the printout to diagnose faults.

A third problem-related command is 'CREATEDD', which creates a Dump Disk. This is a specially formatted disk for use with the stand-alone dump facility. In the case of a system crash which did not wipe the memory-resident dump routines, you can dump the entire contents of memory to a series of diskettes for use in fault diagnosis. The dump is started by placing the dump diskette in the drive and pressing Ctrl-Alt-NumLock-NumLock. CREATEDD creates only the first of such a series of disks, the rest being created during the dump itself as promoted. This initial dump disk pretends to be full to stop you from using it for any other purpose.

'PATCH' is a new command which applies patches to OS/2 and related programs, and is a highly simplified substitute for DEBUG. PATCH has a fully automatic mode which patches a program using a file of patch data distributed by IBM or another software vendor; it is invoked by, for ex-

ample, PATCH BUGFIX /A. If the /A is omitted, then PATCH works in interactive mode, when it resembles the E option from DEBUG, and permits you to enter patches by hand, prompting for offset values.

For a novice user PATCH is easier to use (and more difficult to do damage with) than the old DEBUG, but for the experienced programmer it lacks many essential features, such as search and assemble. DEBUG is no longer supplied.

A multitasking environment like OS/2 presents special problems in the area of I/O, because multiple running programs may want to use the printer or the serial port at the same time. To handle this gracefully, all I/O must be done through operating system services which queue the various tasks to wait their turn. However, old programs written for single-tasking DOS may not observe the necessary etiquette, and the more brutal of them may seize ports directly, bypassing the operating system completely.

SETCOM40 is a command to cope with this situation. It allows a DOS program to directly access COM port, bypassing the OS/2 device drivers. The sort of programs that are likely to need it are communications packages and programs that use a serial mouse or printer. Once you have given a port to DOS — say, by issuing SETCOM40 COM1=ON — it is up to you to make sure that no OS/2 program tries to use COM1 by not switching out of DOS mode till you have returned the port.

SPOOL is the program that manages the queue for the printer. Various tasks may all print at the same time, each thinking that it has the printer to itself. In fact, SPOOL catches the outputs from the tasks, separates them, and stores them as temporary files in a directory which is nominated as a parameter in the command. These files are then printed one after the other, resulting in orderly printing instead of the chaos of jumbled outputs that would otherwise arise. There is seldom any need to run SPOOL interactively, and it is usually executed by CONFIG.SYS at boot-time, with the default spooling directly called \SPOOL.

If you have several printers attached, you can run multiple copies of SPOOL using DETACH. Again, there may be problems for DOS programs that were not written with spooled output in mind; the usual symptom is that they will not print anything at all until you exit from the application. In such cases, OS/2 allows you to press Ctrl-Alt-PrtScr which sends an end-of-file to the spooler to force it to print the file.

The final command I'll mention is

'CHCP', the CHange Code Page command. OS/2 supports multiple character sets through the device of 'code page' switching. A code page is just a national character set stored in RAM, and is identified by a three-digit number. The system can be configured to have two code pages in memory at a time, and the 'CHCP <nnn>' command switches from one to the other. Normally, you will have your national character set as one code page, and the multi-lingual code page, number 850, as the other. The latter has some characters for most European, US and South American languages and is used on IBM mainframes and minicomputers. Printers can also be configured to work with different code pages.

The OS/2 batch processor has all the features of the one in DOS, plus the major addition of the very useful 'SETLOCAL' and 'ENDLOCAL' commands. SETLOCAL saves the values of all environment variables, allowing you to alter them locally and have them automatically restored to their previous values when ENDLOCAL is reached. So, a batch file to run a compiler might completely alter the PATH and DPATH for the duration of its execution without messing up your default/environment.

The command line processor itself has also been beefed up considerably in OS/2. The redirection (>, <, >>) and pipe operators (|) are all retained, but in addition there is conditional processing using AND (&&) and OR (||) operators, plus grouping and separating of commands with ( ) and &.

When two commands are separated by &&, the second is only performed if the first succeeds; success is defined as terminating in a non-error output. For example, the command line 'DIR DICK.DOC && MD DICK' says: 'If there is a file called DICK.DOC in this directory, then make a subdirectory DICK'. On the other hand, 'DIR DICK.DOC || MD DICK' says: 'Make the subdirectory DICK only if there is not a file called DICK.DOC' (strictly speaking, this is an XOR operation rather than OR).

Multiple commands may be given on one line separated by &, when they will be executed strictly from left to right. DIR A: & DIR B: displays the directory list for A: followed by that for B:, both after the second command has run. Parentheses may be used to group such commands to ensure the correct order of execution, leading to sequences like 'DIR DICK.DOC && (MD DICK & COPY DICK.DOC DICK & DEL DICK.DOC)'.

These and other enhancements create what amounts to a job control language, and allow very powerful

batch programs to be written. Used in conjunction with PATCH, for example, it should allow IBM to distribute disks which apply complex upgrades and bug-fixes without any user intervention.

## Memory management, multitasking & programmer's interface

Much has been written since April 1987 about the internal workings of OS/2, so I won't go over it again in great detail. I'll just point out some of the novel features.

OS/2 uses a more dynamic form of memory management than PC-DOS does, and there are two basic mem-

**'The multitask scheduler in OS/2 uses a fairly sophisticated strategy compared to the crude background facilities used in Windows and the Mac Multifinder. The unit of processing under OS/2 is called a "thread", which is a concurrent task . . .'**

ory maps. In DOS mode, the bottom 1Mbyte is devoted to BIOS ROM and the 640k block of DOS working memory; video RAM also lives in this section. In OS/2 mode, up to 16Mbytes of physical memory can be addressed by pukka OS/2 programs, and it is also possible to run DOS-compatible, so-called 'family' programs (programs written using a restricted set of OS/2 functions) in the upper part of memory. Family applications will provide a bridge for software developers in the short term; by following the rules you can write family applications now using DOS 3.3 compilers, and then recompile them more or less unchanged under OS/2 as the compilers become available.

OS/2 supports a limited form of virtual memory, allowing you to run programs that exceed the physical memory size. In IBM-speak this is called 'storage overcommitment', and there are three levels involved.

Firstly, OS/2 can recognise that a program segment is no longer being used and discard it, using the memory for another program.

Secondly, OS/2 can swap out a program segment into a special file called 'SWAPPER.DAT' which the installation process creates in your root directory. If the segment is needed again, it must be swapped back in place of another segment. Obviously, this process can slow down execution somewhat, but with hard disks as fast as that of the Model 80, you will scarcely notice.

Thirdly, OS/2 can rearrange memory to free more space. As segments are discarded or swapped out, memory becomes fragmented with lots of small holes all over the place. OS/2 can compact the memory by moving things around to make the free space into a contiguous block, until it has enough to satisfy a program's request.

Some programs, especially real-time programs and timing-dependent communications programs, cannot tolerate the uncertain delays caused by swapping and moving memory, so these features can be controlled using the 'MEMMAN' command. It is possible to enable and disable both swapping and compaction separately with lines like 'MEMMAN NOSWAP NOMOVE'.

The multitask scheduler in OS/2 uses a fairly sophisticated strategy compared to the 'crude background facilities used in Windows and the Mac Multifinder. The unit of processing under OS/2 is called a 'thread', which is a concurrent task that forms a component of an application. All tasks (or, to be exact, threads) have a priority assigned to them, and multitasking is achieved by giving out slices of processor time to all threads with the same priority on a round-robin basis. An application can belong to one of three classes of activity: time-critical, regular or idle-time, in descending order of 'importance'. There are 32 priority levels within each class. The latter class corresponds to the Windows/Multifinder type of background process that is only run when the system is doing nothing else — for example, waiting for a keystroke.

The priority of regular tasks is dynamically variable, and OS/2 can alter the priority of task to make sure it is run within an acceptable time. The CONFIG.SYS command 'MAX-WAIT' determines the length of time a process can be made to wait before it is uprated to a higher priority — that is, how long it can be left out in the cold by higher-priority processes. 'TIMESLICE' alters the actual size of a single timeslice and can be used to fine-tune the system. 'PRIORITY' enables or disables the dynamic variation of priorities. (Incidentally, OS/2 can only handle up to a maximum of 255 threads, which places a

limit on the number of concurrent applications that can be run. 255 sounds a lot, but one application could use 20 or more threads.)

The programmer's interface to OS/2 is a huge improvement over the low-level software interrupt system of PC-DOS. All OS/2 services are called by their names (for example, `DosCreateThread`, `DosGetMessage`) and parameters are passed to them on the stack instead of in processor registers. This latter feature is a great step towards portability as the operating system is no longer tied to a particular chip architecture. On the other hand, there are now over 900 OS calls to learn as opposed to 90 under PC-DOS.

Another feature provided by OS/2 which excites many programmers is the dynamic linking of modules.

Under DOS, all the modules of your program have to be linked into one large .EXE file before it can be loaded and run, which puts strains on the writing of large programs. Under OS/2 it's possible to leave linking until run time; a program can have unresolved external references which are satisfied by loading a new module while the program is running. This means that code which is very seldom used may never need to be loaded at all, thereby saving memory; and that code which is used very often can be shared by a number of programs, saving disk space. Libraries of linkable code can be updated without having to recompile all the applications which use them. In short, it makes writing and running very large programs much easier.

## Conclusion

There is no question that OS/2 remedies many of the limitations of PC-DOS. It provides an amount of memory which should not prove constricting for two or three years, and the promise of more with the 80386 version. It has a sophisticated system of multitasking which, even in version 1.0, is quite easy to use at the command level. It has many enhancements in the area of command and batch processing, dynamic linking of modules, and more. It provides far more facilities for professionals than PC-DOS ever did. Why, then, do I feel so depressed about it?

The answer is that the huge, complex OS/2 is a big step forward into a realm I do not wish to enter. OS/2 is a minicomputer operating system masquerading as a personal computer operating system, just as the Model 80 is a minicomputer masquerading as a PC. OS/2 will no doubt be excellent for downloading IBM mainframe files to corporate spreadsheets, though a recent report commissioned by Lotus suggests that even large corporate purchasers are being quite chary about the new system, and barely 10% were planning a wholesale changeover in 1989. Most (40%) suggested they would be taking on OS/2 for specific applications, not to replace DOS.

I am not really qualified to say whether or not OS/2 is a good minicomputer operating system, having cut my computing teeth on a Commodore Pet and never having worked a single day in the DP industry. In the hairy early days of PCW, we used to swear blood oaths never to use a computer that needed to stand on the floor, and not to trust anyone who uses 'port' as a verb. IBM, on the other hand, has always wanted to sell us minicomputers; the PC was a highly successful aberration, and industry myth has it that many of the crippling limitations of the original PC were deliberately imposed so that it would not impinge too seriously on mini sales. Now the 80386 has allowed the company to close the circle with a mini/PC.

My own ideas of what my next operating system should look like are as far removed from this leviathan as they are from the patronising hieroglyphics of the Macintosh. I've glimpsed bits of what I like in programs such as SideKick, ProComm, SuperKey, Automator mi and QuickDOS, but nothing as yet which puts them all together. I do know that it is unlikely to come from IBM.

*Estragon: 'Shall we go...'*

*Vladimir: 'Yes, let's go...'*

*(They do not move. Curtain.)*

**END**

## Performance

Testing the performance of an operating system in any useful way is more difficult than the normal Benchmarking exercises that PCW tackles. Nevertheless, it seemed like a good idea to try to assess the relative performance of OS/2 compared to PC-DOS 3.3 when running the PCW Benchmarks. The only language I had in common with DOS 3.3 and OS/2 was the new IBM C/2 compiler, which can compile objects for either operating system. This compiler came complete with Microsoft's Codeview tracer/debugger, though the latter only runs in the DOS mode.

As a further comparison between DOS 3.3 and OS/2 DOS mode only, I also ran the Benchmarks in interpreted BasicA.

### PCW Benchmarks in BasicA

	OS/2 DOS Mode	PC-DOS 3.3
Intmath	0.60	0.54
Realmath	0.82	0.82
Triglog	2.60	2.60
Textscrn	18.01	16.80
Grafscrn	3.62	3.46
Store F/D	11.25	11.25
Store H/D	2.41	3.18

You can see they are almost the same, suggesting there is no penalty for running DOS software under OS/2 DOS mode. Indeed, the hard-disk access appears to be significantly faster under OS/2 than under DOS in this case.

However, this difference disappears in C/2; the timings for OS/2 native mode, OS/2 DOS mode and PC-DOS 3.3 being substantially identical.

### PCW Benchmarks in IBM C/2

	OS/2 Native	OS/2 DOS Mode	PC-DOS 3.3
Intmath	0.007	0.007	0.007
Realmath	0.42	0.41	0.43
Triglog	7.80	7.88	8.01
Textscrn	16.01	15.82	16.20
Grafscrn	N/A	0.32	0.29
Store H/D	0.68	0.69	0.70

A question which fascinates me is this: how much of the 2Mbytes of memory fitted to the Model 80 is available to user programs under OS/2? This proved impossible to determine with the available software. Normally, I would run a little utility called MEM.COM, or, failing that, Norton's or PC-Tools, or, in desperation, CHKDSK. I had none of the aforementioned tools under OS/2 and CHKDSK has been modified so that it shows disk space only.

I was able to run eight copies of the OS/2 command shell before swapping to the hard disk started to occur and opening a new session became noticeably slower (though still only around a second). The shell file CMD.EXE is 57k in size, which would mean that about 456k of RAM was occupied. At 13 sessions, an error box opened up saying that the maximum number of programs was now running and would I close something down in order to proceed. Surprisingly, after closing down one session, I was able to run PATCH in each of the 12 remaining sessions; perhaps PATCH employs code sharing and only one physical copy is loaded, but in that case perhaps CMD.EXE does too. This way madness lies.

# A window into the brain

Neural network research has become fashionable once more. Jack Weber assesses the importance and relevance of recent developments, and asks whether they enable us to understand how the brain works through the possibility of genuine analogies.

There was a time when you could say the words 'electronic brain' with a certain sense of dignity. Now the phrase sounds as up-to-date as punched cards and core stores. But industry watchers will have noticed that electronic brains are poised for a big revival.

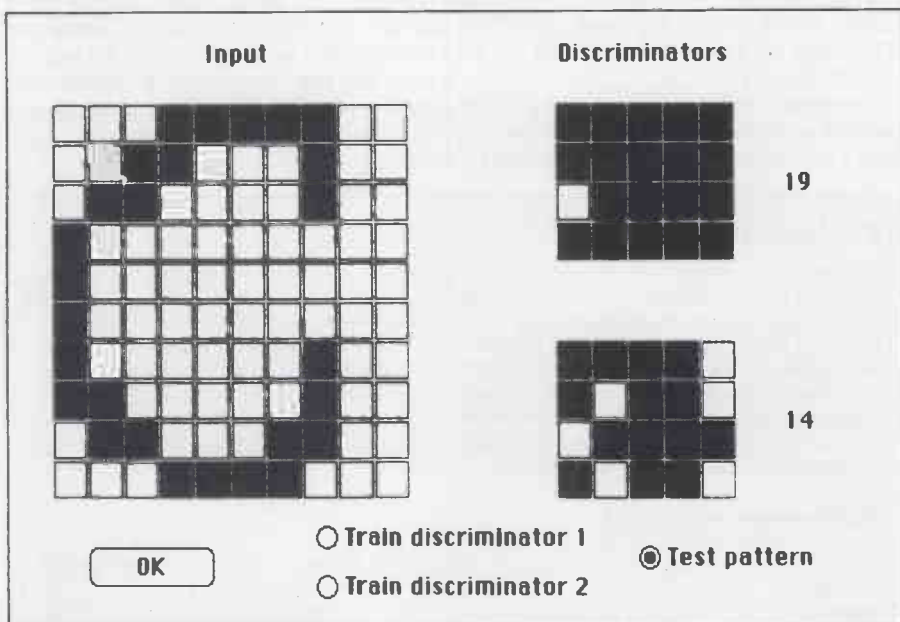

Like most fashion trends, this one has its roots in the distant past. In 1943, before the first real computers had been built, an 18-year-old prodigy called Walter Pitts teamed up with Warren McCulloch, a neurophysiologist at the University of Illinois, to write a paper called *A Logical Calculus Of The Ideas Imminent In Nervous Activity*. It proposed an explanation of how brain cells could operate as digital on/off devices.

As it turned out, McCulloch and Pitts got it wrong. Their explanation was far too simplistic, but it marked the beginning of a stormy marriage between brains and computers that has remained fruitful. At times the brain has been seen as a living computer, at other times computers have been explained as electronic brains. Often the link between them has been fiercely denied. Yet today it seems that some of the most important work in understanding how the brain operates is based on ideas borrowed from computing, while the most exciting developments in computing are using the sorts of structures, called neural networks, which occur in the brain.

## Distributed processing

Examined under the microscope, both brains and computers are made up of vast numbers of simple elements connected together in highly complex patterns. In the case of computers these building blocks are logic gates and memory circuits. In the brain, they are neurons — brain cells which in some respects operate rather like gates.

There are many specific types of neuron but they share certain features in common. Each neuron produces bursts of electrical impulses; the more active the cell, the more impulses it generates. This activity is

The top discriminator was trained on letter 'c's, the lower one on 'o's. This distorted 'c' is identified correctly — 19 is a significantly higher value than 14

controlled by input connections, called synapses, which come from as many as several thousand other neurons. Some of these inputs are 'excitatory', making the cell fire more rapidly; others are 'inhibitory' and reduce the cell's activity. It is the combination of all these inputs which sets the cell's firing rate and so determines the output that will be passed on to further neurons; but the relationship between input and output is likely to be quite complex. What makes this so different from the circuitry of conventional computers is not so much the basic elements involved, because they can be modelled with logic gates, but rather the way that the various elements are linked together.

The pathways, finely etched into silicon chips or printed circuit boards, are the outcome of a deliberate design process so that each one has a precise purpose. Alter any one and that particular purpose will no longer be served — in some specific way the computer will now be faulty. But alter any link in a neural network and all that is likely to happen is that it will tend to be less reliable, occa-

sionally producing incorrect answers or perhaps becoming less able to cope with incomplete data. It's a subtle distinction but an important one, and it arises because of the unusual way that neural networks process information.

Conventional computers follow a standard design called the von Neumann architecture. This consists of a central processing unit and an extensive addressable memory, the two being joined together by a data bus. To speed things up, modern parallel processing machines make use of several, or even very many, processors, with some way of dividing up the task between them and with an overall control system to prevent conflicts. Neural networks go far beyond even these parallel machines to a style of operation called distributed processing in which all the activities are mixed up and spread out throughout the whole network. Whereas, in an ordinary computer, one group of gates may be wired together as a shift register, another group as an adding circuit; in a neural network, any region looks and operates like any other.

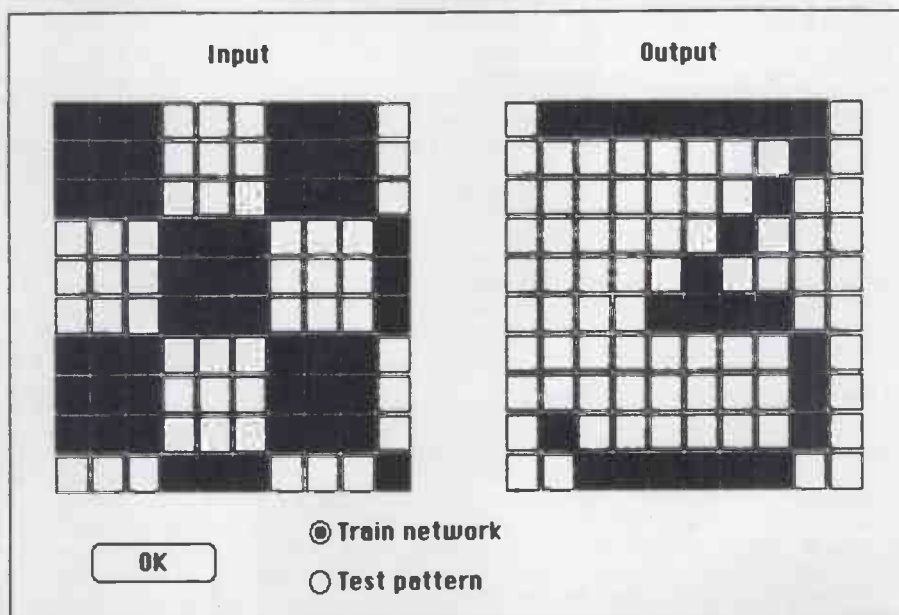

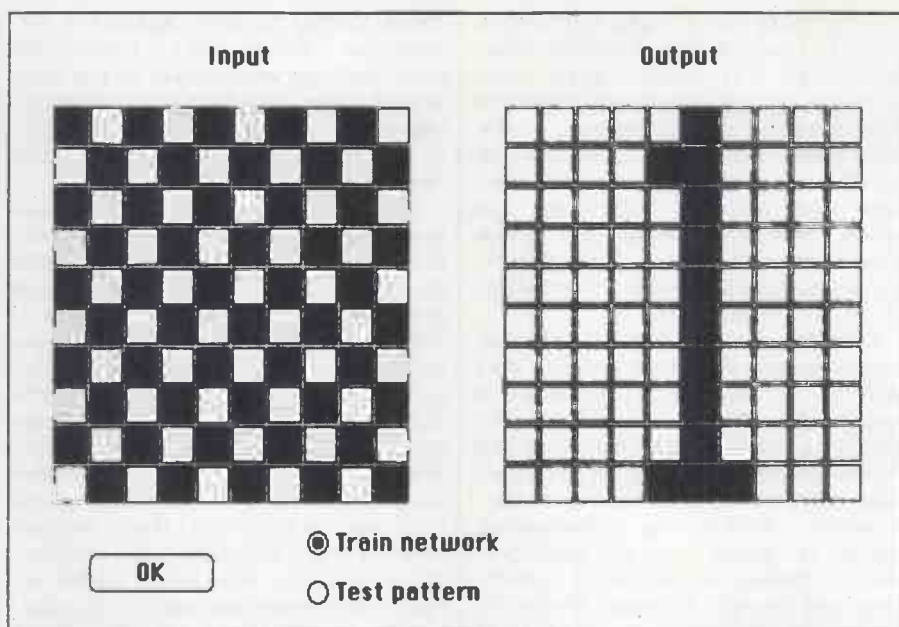

The implications of this distributed approach are significant. For a start, there's the ability (already mentioned) of being able to cope gracefully with faults. That's something that we have cause to be grateful for — an adult brain loses a great many brain cells every day, yet all that we experience is a very gradual decline in our capabilities. Then there is the ability to handle incomplete or corrupted information. The brain is very good at recognising a familiar face from just a fuzzy photograph or understanding speech in a noisy room; so too, artificial neural networks can grasp connections from partial data. The third important ability is that of learning from experience. This is clearly something at which the brain excels, but it is very difficult to program into a computer; neural nets do it naturally — indeed, a neural network cannot be programmed to perform a task, only trained by example. This arises out of another characteristic of neural networks: they are self-organising, able to settle into a stable and meaningful state without requiring the details to be specified. Indeed, we need not know the internal state of a network and, anyway, we could not discover it just by observing its outward behaviour.

There is no evidence to suggest that any electronic neural networks are replicas of the living neural networks in our brains, but they do seem to follow the same general principles and exhibit similar qualities. How close the analogies really are is a matter of great scientific debate at present, but, whatever the outcome of that, there is no doubt that neural networks are starting to have a profound effect on computing. In areas as diverse as robot vision; natural language understanding, the travelling salesman problem and handwriting recognition, neural networks are the fashionable line of research. What is so intriguing is that they have been around almost since the days of McCulloch and Pitts but fell from grace catastrophically and, until recently, were so thoroughly unfashionable that few people would admit to working with them.

## Neural fashions

A dominant figure in this whole field is Norbert Wiener, a mathematical genius who, in 1947, wrote a book called *Cybernetics* and, in the process, created the science of the same name. Among other things, Wiener proposed that the way the brain is built may determine the way that it works and suggested that it might be worthwhile, in trying to understand the brain, to build machines that resemble it.

Three chequerboard patterns stored simultaneously in the Associative Memory with their linked output (see the 'Program information' box on pages 132/133)

Forty years on, it looks as if this is going to prove a very prophetic idea; cybernetics has rather faded from prominence but much of cognitive science rests on this proposal. At the time it was simply not practicable to put Wiener's suggestion to the test. The then current technology of valves and electromagnetic relays was simply too large and power-hungry to build any but the smallest of neural machines.

Nevertheless, in 1952, a British psychologist, W Ross Ashby, was able in all seriousness to write a book called *Design For A Brain*. It's hardly a DIY guide for budding Frankensteins, the limit of its practical aims being an ingenious construction called the Homeostat, which is made up of electronic valves, telephone exchange switch-gear and troughs of water. It was intended to demonstrate what Ross Ashby called 'ultrastability' — the tendency found in living creatures to adapt to environmental changes so that some desired state could be maintained even when external influ-

ences tended to work against it. An analogue device, the Homeostat owed nothing whatsoever to the new digital computers that were developing so rapidly at the time, but it was a forerunner of attempts to build brain-like machines.

In fact, the development of computers and the study of neural networks followed strictly separate paths throughout the 1950s. The rapid progress being achieved in computing did not encourage its developers to get involved in the seemingly impossible task of constructing an artificial neural net. A number of large electro-mechanical and even electro-chemical machines were built in the early 1960s, both in Britain and in the US, but nobody in their wildest dreams could envisage such cumbersome creations ever being useful for real information processing. Ironically, it was the increasing power of digital computers that came to the rescue of neural nets when it became apparent that, rather than build networks, it would be much easier to simulate them in computer software.

Naturally, simulating a vastly parallel system inside a serial computer takes time, but at least it made it possible to study networks of a useful size. During the 1960s neural nets suddenly became fashionable, attracting many researchers eager to explore the possibility of recreating some of the brain's unique abilities. Prominent among them was Frank Rosenblatt of Cornell University, who devised the Perceptron — an artificial vision system using a matrix of photocells as the retina. The outputs of the photocells were fed to a simple neural network that could be trained to recognise visual patterns.

At last, it seemed as if the two strands of information processing were coming together. But the enthusiasm was short-lived. In 1969 Marvin Minsky, one of the gurus of computer science, and Seymour Papert, best known as creator of the LOGO language, showed mathematically that Perceptrons could never form the basis for a general computer. Work on neural networks virtually stopped.

## Program information

The programs which appear in 'Program File', page 200, are designed to demonstrate how a conventional microcomputer can simulate parallel distributed processing by a neural network. Written in Microsoft Basic version 3.0 for the Apple Macintosh, they make extensive use of the Mac's graphical capabilities and mouse, but could easily be adapted for other machines and other user interfaces. They also provide a base from which to delve into more complex neural networks.

Although the two nets are different in their layout and operation, they share many features. Both consist of simple, binary McCulloch-Pitts neurons which are either firing or not. The neurons appear onscreen as small squares — white if the cell's output is zero, black if it is one; with layers of neurons arranged as blocks, so that patterns of cell activity can be visualised graphically.

The method of entering patterns into the neuron layers is based on the FatBits technique used in MacPaint. Pressing the mouse button on a cell changes its value (0→1, 1→0) and the pointer will then point this new value onto any other squares that it is dragged over. The Toolbox routines 'SetRect', 'PtInRect' and 'PtInRects' are used to test whether the pointer is within a block, and then calculation is used to find the specific cell that it is on. The volume name 'MyDisk', which appears in both programs, must be changed to the actual location of the NetLib file containing Toolbox routines.

Both nets need to be trained before they can be used and buttons are provided to select training or testing functions. A pull-down menu offers the choice of quitting the program or restarting with a new net of the same type; on some machines it may be necessary to use cursor keys to move around and set individual neurons, while function keys could replace screen buttons and menus.

## The associative memory

How do we remember the date of the Battle of Hastings or the shape of a cat? Nobody knows, but what is certain is that we don't do it by filing the information away at specific memory locations — human memory appears to be distributed within networks of brain cells. Whereas extracting data from a computer requires that we should know exactly where to look, human memories are often brought out simply by association.

This network demonstrates one way that a simple distributed associative memory can be created. It has two layers of neurons arranged in a symmetrical, bi-directional,

fully-connected network. Fully-connected, because every neuron in the first layer is connected to every neuron in the second; bi-directional, because the outputs of each layer feed back to the inputs of the other; and symmetrical, because the connection weight between any two units is the same in both directions. Several pairs of patterns can be stored simultaneously within the network, and entering any one of them will recall its associated memory in the opposite layer.

Initially, the program asks for the extent of input and output layers; both are arranged as square blocks, so entering '8', for example, will result in a layer of 64 neurons. The two layers need not be the same size. To train the net, select 'Train Network' and use the mouse to enter a pattern in each layer. Pressing the 'OK' button calculates the connection weights needed to associate these two patterns and stores them in the array c%(99,99).

This is a very simple calculation. Each neuron has an output of 0 or 1, and the outputs for the two layers are stored in a%(99) and b%(99). To find the connection weight between the i<sup>th</sup> unit in the first layer and the j<sup>th</sup> unit in the second, convert their 0 or 1 values to -1 or 1 and multiply to give c%(i,j). Training on subsequent pairs of patterns simply involves repeating this process and adding the results to the weights already stored in the connection array. This is all done in the 'Matrix' subroutine by the line:

$$c\%(i\%,j\%) = c\%(i\%,j\%) + ((a\%(i\%)*2-1)*(b\%(j\%)*2-1)).$$

Further patterns may be added at any time; the number that can be stored simultaneously in the net depends very much on the actual patterns, but three separate pairs should usually be possible and, in some cases, five pairs or even more may co-exist. Once trained, the net can be used by selecting Test Pattern and painting a pattern onto either layer of neurons. Press OK and, if it can, the net will respond by recalling the associated pattern in the other layer and then correcting any errors in the input pattern. Simple checkerboards offer a very good demonstration of the network's abilities as even very fragmentary portions should be correctly identified. Some patterns are more difficult and the net may show quite complex behaviour, perhaps combining a couple of patterns if it cannot decide between them; or, sometimes, finding the pattern most unlike what it sees and negating it.

These results are produced by the subroutine 'Compute'. Each neuron takes an input from every neuron in the other layer, so we need two nested loops to calculate a whole layer. Taking the essential features of a neuron in turn: 'Input'

The great Perceptron debacle was based on perfectly valid criticisms but it might have been easily avoided. Perhaps the Perceptron's supporters claimed too much; perhaps they just needed more time to create more sophisticated networks. Whatever the cause of the problem, it took about 15 years before neural networks could return from the wilderness. That return is now taking on the appearance of a triumphal homecoming. A new name — 'Connectionism' — is emblazoned on the banner and new theories legitimise the neural approach.

## Soft in the head

Creating a software model of the sort of neural cells that are inside our heads is, in principle, a straightforward task, though the restrictions of processor speed and memory capacity still limit us to very small nets. Nevertheless, interesting behaviour can be observed even in network simulations on a home micro.

Two aspects need to be considered in designing any neural network. One

is the overall pattern of interconnections that makes the net. The other is the detailed performance of each individual neuron. Any software neuron must be capable of simulating five important functions:

● **Input** According to the arrangement of the network, the neuron must be able to read the output values of various other neurons and use them for calculating its own level of activity. In the simplest form — the McCulloch-Pitts neuron — these are the binary values 1 and 0 (firing or not firing), though it is often more useful to read these as 1 and -1. More complex neurons may use a range of discrete values or a continuous range — possibly, between 0 and 1.

● **Weightings** It is known that real neurons have connections of different strengths, so that the same input will affect one neuron more than another. To simulate this, it is usual to assign a weight to each input. This may be positive or negative (for excitatory or inhibitory inputs) and take discrete or continuous values. The

weight multiplied by the received input gives the value that will actually be used by the cell.

● **Summation** An overall input strength is found by summing all the weighted inputs and taking account of positive negative values. This sum represents the total excitation available to the cell.

● **Threshold** In order to fire, a brain cell needs its input sum to exceed a preset threshold value. This not only reduces the effects of random noise but gives the cell the ability to discriminate between input values. Similarly, any simulated neuron must do the same. If the input sum falls below the threshold, then there is no output; if it is above, then an output will be generated.

● **Transfer function** In the binary McCulloch-Pitts cell the output is simply determined by the threshold function: 0 if the input is below, 1 if it is above the threshold. In cells that have a range of values, there is still no output below the threshold but, above it, some function needs to relate input to output. This may be as

comes from every neuron in the other layer and is held in a%(i) or b%(i); the 'connection weight' (which may be positive or negative) for any two cells is held in c%(i,j). It must be multiplied by the input value; 'Summation' of all these weighted inputs is built up in s%; and the 'threshold' for the cell to fire is zero. If s% is less than zero, the neuron will not fire (output=0). If it is greater, then it will fire (output=1). If it is equal to zero, then the output is left as it is.

The subroutine goes through this whole process to calculate every neuron in the second layer, and then again for the reverse flow of excitation back to the first layer. As the new output of each cell is calculated, it is compared to the old value and then displayed. The differences are totalled in diff% and the network is recalculated until diff%=0, indicating that both layers have stabilised.

## Discriminator

The discriminator is a small simulation of the WISARD robot vision system; it offers impressive pattern recognition from a very simple single-layer network. The program creates a 10x10 block of input cells, on to which a pattern can be painted with the mouse, and two discriminator blocks which score its similarity to previously-trained patterns.

The idea behind it is very simple: we take a random group of five units from the input layer and assign to each of them one bit in a five-bit binary word. If the cell is on, then its bit is set to one, otherwise to zero. Clearly, every possible combination of on and off among the five inputs produces its own unique binary number — the whole pattern can be stored in 20 such numbers. In order to train the net to discriminate between two patterns, we simply enter them both and store the two sets of numbers that result. Any subsequent patterns can then be tested by comparing their numbers to those stored.

This comparison is displayed in the two discriminator blocks. For every one of the 20 random groups of input cells, there is one unit in each of the discriminators. If the number produced by that grouping matches the value for either of the two training patterns, then the appropriate discriminator cell turns on (there may be elements common to both patterns which will, therefore, affect both discriminators). Finally, a score of the number of units matched in each discriminator shows which of the two training patterns was closest to the test pattern.

There are, of course, easier ways of comparing two patterns. But what we want is a system that can generalise by

detecting, for example, the similarity between all letter 'c's and differentiating them from all letter 'o's. This is achieved by training the net on up to five examples of each type of pattern and storing all the sets of numbers produced. When a new test pattern is applied, each cell in the two discriminator blocks acts as an OR gate, showing if at least one of its training examples matches the present value of the group. This gives the system remarkable abilities: training one discriminator on five different hand-drawn 'c's and the other on five 'o's will let it correctly identify almost any other example of the two letters.

The program begins by creating a display screen and building up the random connections, which are different every time. The array b%(19,4) holds a list of the five input cells that each of the 20 discriminator units is connected to. In order to train the net, select 'Train discriminator 1' or 'Train discriminator 2' so as to allocate the pattern to one or other type, then paint it in. Pressing OK stores the values of all input cells in the array a%(100).

The 20 numbers that define this training pattern are produced by the subroutine 'Matrix' and stored in the arrays b1%(19,4) or b2%(19,4) according to which discriminator was selected (the second dimension allows for five examples for each). The effect of setting individual bits in a five-bit word is achieved by multiplying each input value by its corresponding power of two.

When all the examples have been entered, press 'Test pattern' and paint a pattern onto the input layer. Pressing OK directs the program to the subroutine 'Compute' which calculates the value of each group and compares it to all the corresponding stored values. If any of them match, the appropriate discriminator cell is switched on and that discriminator's score is increased by one.

Apart from using it to recognise individual letters, another good demonstration is provided by training one discriminator on five vertical bars, each two cells wide, and the other on five horizontal bars. They will then identify very effectively whether any roughly-scrawled line is more nearly vertical or horizontal. It's an ability that forms an important part of the brain's visual processing.

Everything happens in a single pass so the discriminator is very fast and, unlike most neural networks, provides its response in a fixed, predictable time. Because its individual units are so simple, it is really just on the borderline of neural networks, but it does demonstrate some of the enormous potential of the connective approach.

complex as required.

A single neuron is relatively simple to build as hardware and is easily simulated in software. The complexity all resides in the intricacies of the network. Large numbers of neurons, heavily interconnected, create a system of pent-up energy. Let us suppose that a network is set up with some initial set of values for the weights and that all the cells are quiescent. If some input signals are now applied, cells may begin to fire, providing input to further cells which may in turn excite or inhibit other cells, and so on. The whole network will eventually settle into a stable state consisting of some pattern of cell outputs. We can treat this whole pattern, or some small part of it, as being the output of the net.

Neural nets tend to be arranged in layers; generally, all the cells in one layer take their inputs from neurons in the preceding layer and pass their outputs on to the next one, but there are no hard and fast rules about this. The degree of connectivity between layers is also variable: in a fully connected net, each cell will take inputs from every cell in the previous layer; conversely, neurons may take just a small number of inputs, perhaps from randomly chosen cells. Just as there are many different arrangements of cells within the brain, so there are many types of artificial neural nets and new ones are constantly being devised. The aim is always to find a layout of connections and a distribution of weights such that we can enter certain inputs and obtain outputs which are related to them in some useful way.

With any conventional computer, we would need to create an algorithm — a sequence of instructions that carries out the required task. Neural network: on the other hand, need to be trained by example — we either set an input and directly force connection weights that will give the desired output or allow a combination of weights to develop by iterative steps until the correct output is achieved. Finding learning rules to modify the weights so that the network will rapidly move towards a correct and stable state is one of the central problems of the subject. It was a major factor in the recent unpopularity of neural networks.

The glaring fault that Minsky and Papert had identified in the Perceptron back in 1969 was that there was no way to create an Exclusive . . . OR function: that is, no way of making a cell fire if one, and only one, of two input cells was firing. Without the ability to perform an Exclusive . . . OR, large areas of computing were inaccessible.

The Perceptron was a quite simple

device with just two neuron layers, one connected to the retina, the second providing the output, with a learning rule to set the connection weights between them. The solution which emerged after Minsky and Papert's critique was that the only way to provide an Exclusive . . . OR was to introduce at least one further 'hidden' layer of neurons between input and output. Unfortunately, no-one could find a learning rule that would deal with hidden units. Hence the long exile of neural networks.

Recently a number of new learning rules have been found to solve the problem. The basis of all these methods is to apply the input and allow cell activity to propagate through to the output layer. Then compare this output with the desired output values and adjust connection weights throughout the net according to a mathematical function that will reduce the error. This process is repeated, perhaps thousands of times, until a stable distribution is produced.

## Vision & hearing

The sorts of problems that are particularly suitable for neural network solution are those for which no algorithm is known, or where the only available algorithms are themselves too time-consuming. An excellent example is the travelling salesman problem in which the shortest route joining a number of cities needs to be found. As the number of cities increases, the problem rapidly becomes unmanageable; 10 cities, for instance, offer 181,440 different routes and there is no known algorithm for finding the shortest one other than calculating and comparing them all. Recently trials with a neural network at Bell Laboratories gave a best or nearly best answer about 75% of the time. With a specially built hardware network it is thought that such answers could be provided in a fraction of a second.

Neural networks are especially successful in the traditional AI activities of robot vision and speech recognition. One of the most talked about networks at the moment is NETalk. It is a self-learning net built at Princeton University which takes text as its input and drives a phonemic speech synthesiser with its output. Initially, with random connection weights, it babbles completely incoherently. But given training in the form of matched pairs of written words and phoneme patterns, it adjusts its connections until, after about a day, it is chattering away pretty intelligibly.

But image processing has produced perhaps the most practical applications: the Perceptron, remember, was an early vision system and

now one of the few neural networks to have become a commercial product is a visual device called WISARD.

Designed at Brunel University, WISARD consists of a video camera attached to a large but simple network. It can successfully tackle problems that would be way beyond traditional algorithmic AI techniques. For example, train it on a number of smiling faces and a number of frowning ones and it will correctly identify the expression on almost any subsequent face it sees.

Other possible uses are optical character recognition, analysis for medical imaging, deciphering handwriting and so on. These are tasks for which no rigid algorithmic set of instructions exists, but neural networks excel at precisely such problems. What matters is that there are genuine similarities between smiling faces or between all examples of the letter 'A'; we may not know how to define those similarities but, with a neural network, we don't need to. Their internal workings are just a means to an end: we don't need to specify them, we don't even need to know them. WISARD is one of those nets which has totally random internal connections.

## Conclusion

As long as the bulk of research is done on simulated nets the real world applications may be restricted, but already some special neural network chips have been built by Bell Laboratories and they offer the prospect of true parallel processing speeds. Going even further, the obvious technology for such massively parallel structures is optical processing. At the California Institute of Technology, a pattern recognition system has been built which, given an input image, can select the matching image out of several stored within a hologram. So far, its achievements may appear modest. But the fact that holograms offer enormous storage density and that light beams can cross each other without interference implies that very large and dense neural nets may be achieved in this way.

Ultimately, what makes neural network research important to us is the possibility that it may provide genuine analogies for how the brain works. If that is the case then it offers the prospect of some real artificial intelligence. But, more importantly, it could open a window into the brain. Being able to simulate even just a tiny portion of the brain would help us to understand it, treat it and perhaps make better use of it.

The program listings which accompany this article are in 'Program File' on page 200. **END**

# LOGITECH MOUSE

From the World's Leading Mouse Experts

At LOGITECH, we have spent years developing the most advanced mouse hardware and software and we have earned the reputation of the world's leading mouse experts. As proof of our unsurpassed engineering, the LOGITECH Mouse has been chosen by many of the world's largest computer manufacturers - Apollo, AT & T, DEC, Epson, HP, Nixdorf, Norsk Data, Olivetti, Zenith.

Our mouse and bus mouse are high quality products, offering you the latest mouse technology at the lowest available price.

Purchase our best selling LOGITECH Serial Mouse or Bus Mouse and Plus Package (including Mouse Driver, Click, Logi-

menu, Point & Click Shell for Lotus 1-2-3, Point, Text Editor) with CADD, Paint and Publisher software at very affordable prices. Each package is a complete solution that gets you the results you need right now.

## Advantages and main features

- High resolution (200 dpi) - a must for all CAD / CAM applications
- Opto-mechanical technology offering the best of both worlds - optical precision and the rugged durability of mechanical technology
- Reliability
- Ergonomic design, no need for grid or pad
- Compatibility with all the major hardware and software
- Easy to install, easy to use
- Best mouse software

*Get your hands  
on more  
solutions*

LOGITECH has selected for you some of the highest performance graphic applications to be bundled with the Mouse or the Bus Mouse.

## CADD Solution

The LOGITECH Mouse, Plus Software and LOGICADD (Generic Cadd 3.0 plus DotPlot). Everything to turn your PC into a full featured CADD workstation. It is the complete solution for dimensioned line drawing and CADD.

## PAINT Solution

The LOGITECH Mouse, Plus Software and LOGIPAIN (PC Paintbrush). With 11 types fonts and a 16 colour palette, it's the paint set that's used by professionals and beginners alike.

## DESKTOP PUBLISHING Solution

The LOGITECH Mouse, Plus Software and PUBLISHER Software (PFS: First Publisher). It's the complete package that makes it easy to produce high-impact, professional looking documents.

# SideKick Plus

Addicts of Borland's memory-resident SideKick program for the IBM PC and compatibles may be sitting comfortably now; but the enhanced version, SideKick Plus, has much to offer. Dick Pountain was very impressed with its ease of use and increased power.

**B**efore proceeding with this review of Borland's SideKick Plus I must declare an interest, namely that I am a hopeless addict of the original SideKick. Since I first laid eyes on the program (in a review for *PCW* some years ago) it has never been off my computer, and I estimate that I use one or other of its component parts at least 50 times a day, every day.

While ruminating on the reasons for SideKick's success, it came to me that in fact all it does is what the operating system ought to be doing; it's an extension which drags PC-DOS, kicking and screaming, from the gloomy Teletype-based world in which it was born into the world of colour and memory-mapped video which the hardware supports. Of course, hardware has now moved on into new realms of bit-mapped graphic displays and soft fonts, so SideKick represents a character-based compromise between the CP/M style scrolling 'glass teletype' and the fully graphical interfaces of GEM, Windows and the Macintosh.

For example, the Notepad's file window provides a handy (if limited) way of locating files without quitting your present application. The Dialler serves admirably for online documentation and for other reference data such as international dialling codes, metric/imperial conversions and the like; and Notepad's cut-and-paste facility in conjunction with a disk editor like Norton Utilities has more than once enabled me to retrieve lost data files.

When the news of SideKick Plus first arrived, I made up a shopping list of the improvements I would like to see in it. First, by a long way, was the provision of multiple Notepad windows, followed by a more powerful database function in the Dialler, and a more extensive Appointments calendar with an alarm facility. Borland has provided all these things

and much, much more. SideKick Plus is a very ambitious product indeed, to the point where it can no longer be considered a resident utility, but rather has become a whole operating environment; it even has hooks for third-party software houses to write applications to run under it. It is consequently much larger and very much more complex than the old SideKick. Despite my initial forebodings that Borland might have gone 'over the top' with SideKick Plus, I discovered that the same intelligence and elegance of design that initially attracted me are still there, and certain new features like the customisable menu system represent a real breakthrough in user interface design. Within a few days SideKick Plus became even more indispensable than SideKick, and now the idea of going back to a single Notepad is unthinkable.

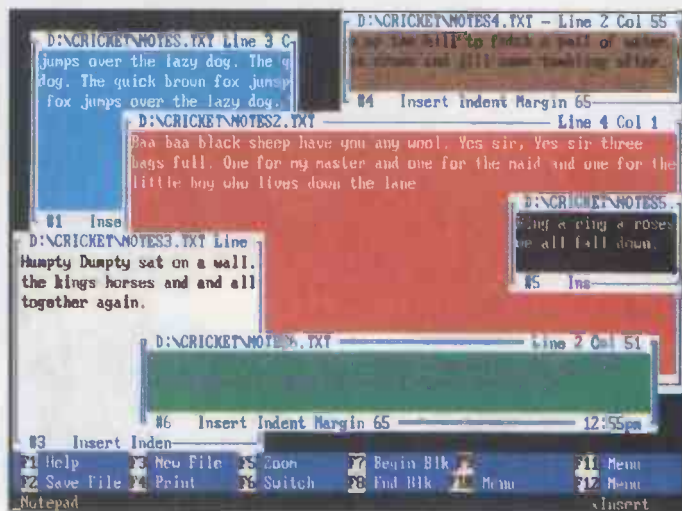

This review was performed on various preliminary versions of the SideKick Plus software (SK Plus from now on for brevity), and was completed before the first release version became available. Nevertheless, all the parts of the system were complete and working in the last version

(0.83 Beta) that I used, and it was stable enough to use for serious work — if not entirely bug-free.

Because of its large size and the memory limitations of PC-DOS, SK Plus employs a clever and complex system of memory management to squeeze itself into less than 640k. Its size also prevents it being distributed as a single .EXE file, as it exceeds the capacity of a 360k PC disk; this also means that it is impossible to use without a hard disk. SK Plus is distributed as a number of libraries, on three disks, from which you build a system including and excluding parts as you require. The end result is a .EXE file which can be loaded at boot-up time and remains partly memory resident; a main menu, similar to that in the original SideKick, pops up when you press the CTRL-ALT keys simultaneously.

## Applications

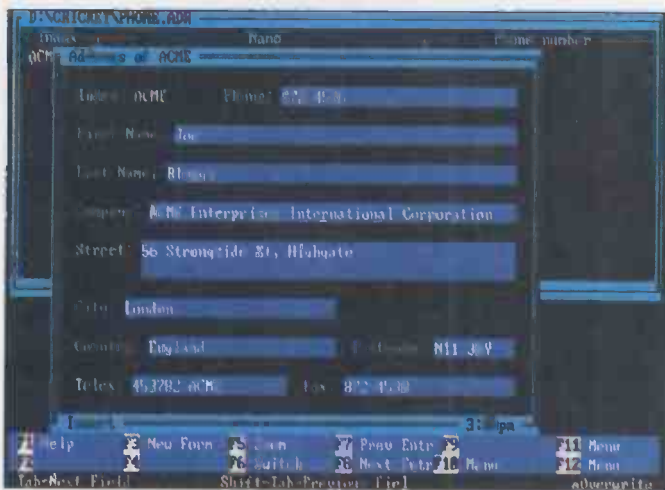

SideKick Plus comes supplied with seven basic applications, two more than the original SideKick. These are the File Manager, Notepad, Outlook, Phonebook, Time Planner, Calculator and ASCII Table. Of these the File Manager and Outlook (a ThinkTank-

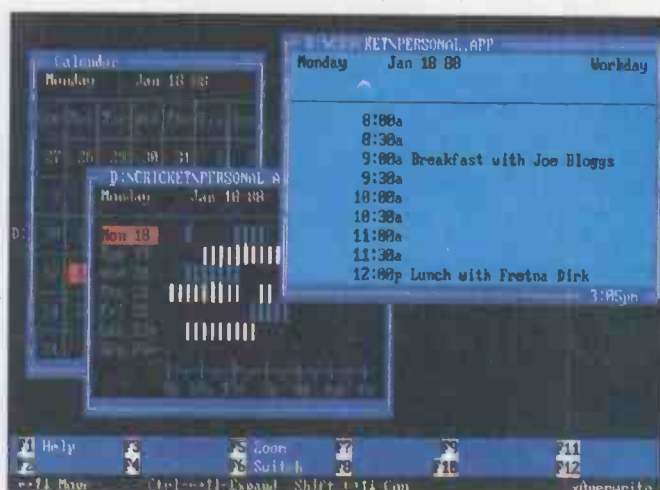

Up to nine Notepads can be opened simultaneously with SideKick Plus. The active window has a double line as its border. Switching between active windows is easily achieved with the F6 function key

# SCREENTEST

The modestly-named Phonebook is a fully-automated communications and telephone management system. This shows an expanded window in European format

The Time Planner personal-organiser style system includes a month planner. The bars represent appointments, under which are the calendar and diary windows

style outline editor) are wholly new, and the other five are greatly improved versions of those in the original SideKick; Phonebook is the new Dialler and Time Planner is the new Calendar.

## File Manager

The File Manager, as its name suggests, is a DOS shell program for managing files. It performs a similar function to standalone utilities like Xtree, QuickDOS or the Norton Commander, and shares features with all of them. It takes the place of the file window in the old SideKick, appearing on the screen automatically whenever a file name is requested, and you reply ambiguously (that is, with a directory name, a wildcard specification or nothing at all). The File Manager can also be chosen from the main menu as an application in its own right, and multiple File Manager windows can be on the screen at the same time, which is very handy for people with several hard disks or partitions.

File Manager supports all the housekeeping functions you would expect, such as Rename, Delete, Copy, Move and Modify file attributes. It enables you to mark a group of files and perform a function on all of them, equivalent to 'tagging' in Xtree and QDOS. Also, floppy disks can be formatted from inside an application, which will delight users of certain hostile word processors. The directory listing in the File Manager window can be sorted by name, extension, size or date and restricted by a wildcard specification. File contents can be viewed in ASCII or hex format; the search function finds files across directory boundaries on a hard disk; a string search finds all files containing the specified string. Unlike Xtree and QDOS and similar utilities, File Manager cannot show

you a graphic tree diagram of your directory structure.

## Notepad

The Notepad is not very different in its fundamental workings from that in old SideKick. The biggest difference is that you can have up to nine of them. When you hit N for Notepad in the main menu, a submenu appears showing the nine Notepads and the names of any files that are attached to them. You can select one from this menu to open. Notepad windows can also be opened directly by pressing the ALT key and a number from 1-9.

When you have several Notepads on the screen at once, the top or active one is indicated by a double line as its border, while all the others have single ones (this indication is used throughout SK Plus). A Notepad can be removed from the screen by pressing ESC when it is the active window; its file remains attached and open, ready for it to be reactivated. You can cycle through all the visible Notepads in the order they were opened by pressing the F6 'Switch' key, or bring a particular one to the top by pressing ALT <number>. The border of each Notepad window is crammed with information, including the number of the Notepad, the filename currently attached, the current time and the status of various toggles like Insert/Overwrite; there is also a little indicator that shows whether the file contents have been changed.

Changing the file attached to a Notepad is accomplished by pressing F3 and typing its name, or by using the File Manager. You are warned, as before, about saving files which have been altered, and there is an option to save all Notepads, which is very handy when shutting down with several active. Default files can be

assigned to Notepads, so that they will always start up with these files attached. I found it very convenient to keep AUTOEXEC.BAT and my address database permanently attached to two Notepads.

The main editing commands remain unchanged, based on those of WordStar. There are, however, some extra ones, like greatly enhanced search options (including 'sounds like' matching using the Soundex algorithm), better tab and margin controls, and the option to switch off the automatic creation of .BAK files (which makes me very happy indeed). Dot commands are supported for headers, footers and conditional pagebreaks.

In short, the Notepad is as powerful as many word processors, and had I not been spoiled by my customised PC-Write I would happily use it for serious writing. One area Borland has not enhanced is the memory management of the Notepad; its files are still entirely RAM resident and limited to around 54k in size.

## Outlook

Outlook is a pop-up outline processor, and the best outline processor I've tried, comfortably beating Think-Tank, PC-Outline and Ready! in elegance and ease of use, and rivalling Mac programs like More. As with the Notepad, you may have up to nine Outlook windows open at the same time with different files. Outlook allows you to enter and manipulate structured outlines, composed of headlines, subheadings, sub-subheadings, and so on. There are the usual pruning functions for moving blocks of headlines from one level to another and from one part of the outline to another.

There is no word-wrap, every line being treated as a separate headline (of arbitrary length). If you want a

substantial quantity of word-wrapped text to appear under a headline, you use the 'Attached Note' command which pops up a window identical to a Notepad window and allows you to associate any amount of text with the headline; this note text is stored in the same file with the outline. This scheme neatly overcomes the contradiction between the ways of handling word-wrapped text and structured headlines that messes up the user interface of many outliners.

Headlines which have associated notes are marked with three horizontal bars in the right margin. You can have any number of attached notes in an outline, but they seem to be limited to around 5k per note. Nevertheless, this is a way of creating larger documents than the Notepad alone permits; you must divide the text up into sections smaller than 5k with their own subheads.

The entry of headline text into Outlook is delightfully simple. Pressing RETURN gives you a new line at the same level, while ALT RETURN gives you a new line at the next level down. Pressing TAB while on a line demotes that headline one level, and SHIFT TAB promotes it. Using these simple keystrokes, structured text can be typed as fast as into an ordinary word processor. The text under a headline can be folded away and hidden by pressing the Keypad key and revealed again by pressing '+'. If you prefer you can select 'browse mode' in which the text under a headline automatically unfolds when the cursor moves onto it, and closes again when you move out.

Outlook can import text from other sources, and will try its best to structure such text as an outline. For example, if you read in a Turbo Pascal source program, it correctly identifies BEGIN...END blocks and structures the text so that only the procedure names are visible at the top level. Printing is flexible, with a variety of numbering formats and automatic generation of a table of contents.

A most impressive feature of Outlook is the diagram drawing facility. By selecting the 'Insert Diagram' command, you can 'paint' block diagrams with the cursor keys or mouse, using the IBM extended box characters; corners and intersections are automatically closed correctly. Any outline at all can be automatically printed out as an organisation chart, merely by selecting the 'Output Chart' command; each headline is printed in a box, arranged in a tree structure from the top down. You can alter the default width and depth of the boxes used.

Many charts will be too wide to print in one piece, so Outlook helpfully chops them up into slices the

Outlook offers all the features you might expect from a dedicated outline processor. The diagram-drawing facility makes it extremely easy to draw tables and boxes in the manner shown here

size of your printer paper, which can be stuck together later.

### Phonebook

The Phonebook has come a long way from the crude Dialler in old SideKick. For one thing it has acquired a fully-featured communications package which can work in the background; you can upload and download files while continuing to work on your PC. The Phonebook is now a proper database program, with indexed searching in place of the glacially slow sequential search of Dialler, and with structured records in place of single-line addresses.

The Phonebook window is divided into three columns, marked Index, Name and Phone Number, and each entry occupies a single line. This, however, is only a restricted view of the underlying record, which may have many more fields, for name, address, comments, and so on. Eight predefined forms are supplied, covering commonly used US and European address formats, mailing labels, personal and business and Email services, but the user cannot define new forms which is a definite drawback.

The indexed search is very quick but there is an even quicker partial search which works only on the first letter; if you press the 'T' key you will instantly jump to the first record whose index begins with T. It's a pity this principle couldn't have been extended to the succeeding letters so that you could home in on the required entry. When the bar cursor is over the entry you want, you can press RETURN to dial the number (supposing that you have an autodial modem connected, of course). Pressing SPACE opens a window which shows the full form for that record. When entering a new address you can choose any of the eight forms provided, and the Phonebook automatically keeps itself alphabetically sorted. If the forms do not hold

enough information for you, you can Attach a Note to the entry, just like the ones in Outlook. The search facility permits searching through these notes, as well as the index entries and the forms.

Any Phonebook entry can be declared as being of Voice or Data type. If you declare it Data, then you can associate a set of communications parameters with it, and optionally a log-on script too. Though it's possible to keep as many different Phonebooks as you want, it is not essential; you can keep ordinary voice numbers and online services in the same book. A password protection system protects private information from prying eyes.

The script language is one of the best I have seen, with a clear Pascal-like syntax, and full looping and conditional branching. You edit scripts via a Notepad window just like a note, but on exit the editor checks the script syntax for you and places the cursor over the site of any error. If the thought of programming makes you blench, there is a learn mode which will write a script for you as you go through the log-on procedure manually. The background communications mode works, and I was able to download mail from BIX while writing this review in the foreground. Simply pop-up the Phonebook, dial the number with the download script attached, pop it down again; a hideous electronic burble, reminiscent of an arcade game phaser, is the only indication that the mail has arrived safely. I quickly came to love the Phonebook, which has even replaced the excellent ProComm in my affections.

### Time Planner

The Time Planner has advanced even further than the Phonebook. When you first select Time Planner from the main menu, a window which looks just like the old SideKick one-

month Calendar appears, with today's date highlighted. Even this is improved, however; you can move the highlight using the cursor keys to a new date, rather than typing in the number as before. Pressing the 5 key on the keypad returns you instantly to today, which is handy when you are groping around finding out what day of the week the First World War ended on. Pressing the F5 'Zoom' key opens up a whole new ball game. A new window called the Schedule window appears which shows the next week, one day per line with a horizontal scale of hours. Your appointments appear as horizontal bars, as on a wall chart, indicating their duration. You have the option of expanding this display to show the next two or four weeks at a glance. Moving the cursor to a day brings up the Appointment book for that day.

The Appointment book itself is hugely enhanced. You can choose the resolution, from hourly to five minute intervals, and the start and end of your day. You can designate days as holidays, which then appear as such in the Scheduler (weekends are already marked as holidays; some hope!).

Each Appointment still occupies only a single line, but you can have as much text as you want, automatically scrolling sideways.

However, for a lot of text you will probably prefer to attach a note (an Agenda) to the appointment, as in Outlook or the Phonebook. It's also possible to attach a note to the whole day, called the Daily Agenda, and this can be inspected directly from the Calendar or Schedule windows. The search facility allows you to string search through all the Appointments and Agendas, as well as for free periods of a specified duration, holidays included or not ('I can give you a 13 minute breakfast meeting on 1 March at 7.03am').

An interesting facet of the Appointments book is that it has been designed with networking in mind. In addition to your Personal book there is a Common Appointments book, password-protected so only authorised staff can alter it, which can be shared by a whole work group for scheduling meetings.

An alarm system allows you to set buzzers for a particular time/date, with pre-warning and 'snooze' facilities. It can also open the Phonebook and make a call at a certain time/date, or 'paste' a string into the underlying application at a certain time/date.

This latter facility enables you to run other programs automatically. All you have to do is paste suitable commands at the DOS prompt.

## Calculator

The Calculator is no longer *one* but *four* calculators; you can switch the type to Business, Scientific, Programmer or Formula. All four types share the same screen image, which is rather less 'realistic' than of old since it lacks a keyboard. Instead, the calculator now has a 'paper tape', like a desk calculator, which records all the calculations performed, may be edited by using all the Notepad commands and can be stored as a named file. You can import a block of figures from the screen of another application onto the tape and then calculate them. All calculations are performed to 18-digit precision.

**'While ruminating on the reasons for SideKick's success, it came to me that in fact all it does is what the operating system ought to be doing . . .'**

The options available in the four types of calculator are far too many to enumerate here. The Business calculator now has the percentage function notoriously lacking from the old SideKick, but also has a range of functions to do with interest and future payment calculations. The Scientific model has 18 trig, log and other maths functions, and the Programmer has variable number bases and Boolean functions. All the calculators share the ability to use named variables in calculations, and the variables in use can be listed in their own window for inspection or editing; in the Scientific mode several universal constants such as pi, g, mu and h are predefined with symbolic names. The Formula calculator combines all the functions of the other three types, and also has the ability to store up to three symbolic formulae for repeated calculation. In theory you only need this one calculator, but the others help to avoid frightening people with too many features.

## Clipboard & ASCII Chart

Though it doesn't feature by name on the main menu, the Clipboard deserves mention because the enhanced cut-and-paste functions are perhaps the most attractive feature of SK Plus. Where the old SideKick had a rag bag of import and export functions (for example, different commands to export from the Calcula-

tor and Notepad), SK Plus has a powerful, consistent ability to cut-and-paste from any application to any other.

Cutting and pasting in underlying non-SideKick applications is performed by the CTRL-DELETE and CTRL-INSERT key combinations, and you can do this at any time without needing SK Plus to be on the screen. Pasting from any SideKick application to any other is performed by selecting the date (for example in the Notepad, as a block) and pressing ALT-ESC, which copies the data into the application or window which lies immediately below, at the cursor position. In applications which use structured data, an appropriate action is taken; in the case of the Phonebook a whole record is pasted; in the Scheduler the time and date is pasted, and so on.

All these cut-and-paste functions work via the Clipboard, which is a special Notepad window that you can inspect and edit, like that on the Macintosh. The currently active item (that is, the one which will be pasted) is always the first item in the clipboard and is highlighted, but previously cut-and-pasted items remain there in order, which is wonderful for accumulating clippings from various documents into a new document, for example.

SK Plus retains the priceless ASCII chart, but it too is now more powerful. It has a buffer in which you can assemble strings of non-typeable characters for pasting into documents (like an electronic Dymo label), and a clever system for enclosing or separating such strings with a chosen character. For example, if you are writing Pascal you could have all strings wrapped in single quotes, or they could be separated by commas.

## User interface and customisation

Having sketched out *what* SideKick Plus does, now let's examine *how* it does it. You will probably have gathered by now that SK Plus has a great deal more functions than old SideKick. SideKick originally got by with a single-line menu at the foot of the screen, indicating the function key assignments. SK Plus needs two lines at the foot of the screen for function keys, together with a whole system of GEM-style drop-down menus. The good news is that the system is well-designed and rapid to use, and, what's more, if you don't like it you can change it.

Certain function keys are used consistently throughout SK Plus. F1 always provides context-sensitive Help. F5 is the Zoom key which instantly toggles a window between its default

size and full screen. This feature has a huge effect on usability; it's quite practical to have eight or more small windows on the screen when you can expand the one you wish to work on at a single keystroke. F6 is the Switch key, which makes the next visible window active, in cyclic order. F7 and F8 in most applications are used to mark block beginning and end, and F10 summons up the drop-down menu system.

The drop-down menus actually resemble those on the Amiga Workbench more than GEM; when you select an option a new menu may drop down from that point, slightly offset to one side. The menu system is context-sensitive, so that only options which are currently available appear on the menu; for example, if no block is selected then the Block Move option doesn't appear. All menu choices can be made either by moving the bar cursor or by pressing the first letter of the option name, and as you become familiar with the location of things, you tend to use sequences of letters (cf. Lotus 1-2-3) without looking at the menus. Some of the menus go down to four levels deep, but this is only for default settings and other parameters, commonly used commands always being at the top level.

**'SideKick Plus is a very ambitious product indeed: it can no longer be considered a resident utility, but rather a whole operating environment ...'**

The menu system is fully customisable, a feature I have never encountered before. You can cut any menu option and paste it somewhere else in the menu path, perhaps at a different level. You can add new menu levels, or remove a level. You can assign any menu option to a function key or assign a keyboard 'shortcut' to any option.

Changes you make to the menu system can be saved permanently once you are happy with them. You can also alter the colours, size and position of any of the scores of windows, interactively, at any time, by pressing ALT-W to bring up the Windows menu.

Setting up all the SK Plus windows to your satisfaction can be quite a task and can take a long time as, for example, each Notepad must be col-

oured separately. Once you have got it right you don't want to lose all that effort, and so the Services option on the main menu allows you to export the whole set-up as a file, which can be imported into any other SK Plus system.

## System building & memory management

As I mentioned at the beginning of this piece, SideKick Plus is supplied as a set of modules and libraries on three disks. You need to copy all these to a hard disk, and then use the program called SKBUILD to link these modules into a system. SKBUILD is a menu-driven, interactive program and very simple to use. You pick those applications you wish to include from a menu, and set certain default memory sizes by sliding a bar with the cursor keys. You can choose how many Notepads and Outlooks (from 1-9) to include, though cutting down saves no memory. This is also where you tell SideKick about your modem.

Borland intends to release the linkage specification to third-party software houses so they can write new applications that can be linked into SideKick Plus. You could have, for example, a spreadsheet or graph program on the main menu. How many will take up the offer remains to be seen, since the market is fragmenting at an alarming enough rate already, what with GEM, Windows and OS/2 to worry about.

Memory management in SK Plus is so sophisticated that it almost amounts to an alternative operating system. The program can be loaded in either swapping or fully-resident forms, and a number of permutations in-between.

The fully-resident mode is just like the old SideKick, all of the program being loaded into memory. A full system will take up about 256k in this mode, and all the applications will respond instantly.

In swapping mode only the kernel of SK Plus, which is 67k in size, is loaded into memory. This kernel controls two separate virtual memory systems, one for code and another for data. Every time you switch applications, the code will be read in from disk, and data will be continually swapped between memory buffers and disk. As you would expect, this mode slows the response time of SK Plus; on my slow PC it takes about three seconds to pop-up after you hit CTRL-ALT, and five seconds to pop down again, but on a fast AT clone it would be quite acceptable. The amount of main memory tied up is tiny (less in fact than old SideKick!) but a great deal of hard-disk space is used by the swap files, which can

exceed 1Mbyte in size.

SK Plus can also use an Above Board (or equivalent) expanded memory card, or a RAM disk to hold its swap files, in which case the degradation of response time is negligible, and you get lots of free main memory. To use this option you must select it when originally build-

**'SK Plus has more functions than Old SideKick . . . the good news is that the system is well-designed and rapid to use, and you can change it.'**

ing the system with SKBUILD.

You can even alter the memory strategy *after* SK Plus has been loaded. Running a program called SKBAT with a memory size as its parameter will reconfigure SK Plus, on the fly, to occupy that amount of memory. If you choose a figure between 67k and 256k then swapping will still occur, but less frequently and to a lesser extent. When building a system with SKBUILD you can also alter the various buffer sizes, and specify that a particular subset of the applications be made fully resident (that is, non-swapping).

## Conclusion

I was initially worried that SideKick Plus would prove to be overcomplicated. I was pleasantly surprised. After a few days of familiarisation it becomes as easy as the original SideKick, and the increased power of all the components is so welcome that I would find it impossible now to go back.

It's important to recognise that SK Plus is quite unusable without a hard disk and is not really much use without 640k of RAM, too. In these respects it is typical of the new generation of 'muscle' software.

As truly multitasking environments like DESQView, Windows/386 and OS/2 gain in popularity you may query the need for pop-up accessories like SideKick Plus at all. In my view, the individual applications in SideKick Plus are of such a standard that I would be hard put to better them with a collection of standalone applications, and the cut-and-paste facilities would be far less flexible in such a mixed bag.

I remain an addict.

The price of SideKick Plus had not been fixed at press time.

END

# More Mbytes for your money

Newbury Data – specialists in the mass storage market for more than a decade have taken the successful Amstrad® PC 1640 range and IMPROVED it!

## HOW?

By fitting our 40 Mbyte disk drive, the PC 1640 now has twice the capacity and greatly improved data throughput as a result of our superior 39ms average access time.

This not only makes it better value . . . but the increased capacity provides a viable professional solution for Desk Top Publishing, Databases, Office Word Processing and Accounts Packages.

## INTERESTED?

# Holiday in Metropolis

The computer game that takes your time and money, at home and in the arcade, wasn't just thrown together: there has been a storyline, months of program development, and the collation of all the elements into an action-packed whole. Graham Devine traces the history of his own creation, Metropolis.

Once upon a time, I was walking around the 1986 PCW Show with a two-page outline for a computer game called Static. I approached Mastertronic's stand and was hastily thrust a can of beer. After being invited along to the company's offices the next week to follow up its interest, I signed on the dotted line and the rest, as they say, is history.

Many moons later, the game began to emerge; in June 1987 at the Chicago CES as a pre-release version, and then at the 1987 PCW Show when the final version took the stage.

## The scenario

The first stage in the creation of any game is designing an outline, or scenario. According to the writing on the box: 'Metropolis the computer game allows the player to walk, live, exist, and die in the confines of a huge city, situated somewhere in the player's imagination. You may talk to any of the characters and walk freely among the city streets.'

The (real) idea of the game is to progress through the levels of the city to get to some distant place. The reason? To fetch back the master tape of a game stolen from IC&D by a rival software house. Changing level is simple: all you have to do is use the ZoomTube — you are even told where it is! The only problem is that although the city has been built for human occupancy, there aren't any humans! The droid at the ZoomTube seems to be a little crazy, and requires you to follow the ZoomTube's strict rules to the letter (presumably made up after all the humans had gone). You can talk to any of the robots and they will talk back (using synthesised speech and a small AI module). There is also a newscaster who adds a backdrop and time limit in which you have to solve the crime, as well as providing more information.

The name has changed from Static to Metropolis, but the actual format of the game hasn't changed too much from the original idea except that I didn't intend to spend quite so long writing it!

*'This is Pixel Sprite, reporting for the IC&D news. Metropolis has had a patchy history. It started as a haven for hackers and ended up the trendiest place for those up and coming software designers. All of the giants are here: IC&D, Mastertronic, Arcadia, to name a few.'*

Metropolis is dominated by adverts, and I initially felt that this was really what the game was all about. As time progressed, deadlines drew close and the coffee cups piled up, I changed my mind. This game is about something completely unrelated. People should be able to work

out what it is; after all, I give enough hints!

The news reports in Metropolis consist of a series of 25 bulletins made up to set the pace for solving the crime. At the end of the twenty-fifth news item, the city level blows up and becomes Martian property, and so on.

The tricky thing here was trying hard not to be political, but at the same time make the news interesting. War is a good subject, but very hard to report. So, I stuck more to the impossible (invaders from Mars, rabbits taking over . . .). For example, here are the first four newscasts from level one of Metropolis:

*'... Thank you for that, Bob. Reports are coming in of a robbery at the IC&D main office, police refuse to comment right at this moment.'*

Here, the crime for the human to solve is introduced, as is Bob Sleight, the co-host of the IC&D News.

*'Following the robbery at IC&D the police have issued the following statement: we believe the villain to have bathysiderodromophobia, but of course that may well be supposititious, we will be able to say more after a more thorough perulustration. For those with icondite prose our police are programmed to have a fulgent logodaedaly rightly ...'*

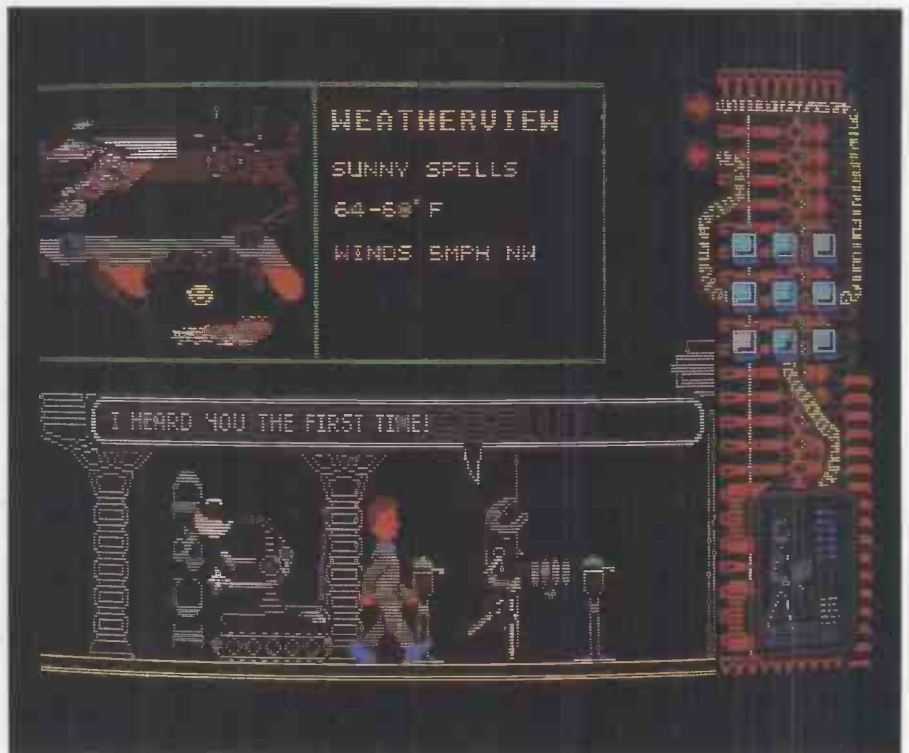

We keep up the robbery at IC&D coverage for a while; this time bombarding the player with long and apparently meaningless words:

*'This is the IC&D news. Following reports on Newstar 3 of a raid by terrorists in the Northern Quadrant, TV 1 has not carried the story. Apparently, there is some doubt over the validity of the story.'*

This story builds up to reveal the fact that television companies are fighting a real war to attract the maximum number of viewers, and can, therefore, charge lots of money for the adverts.

## Development

All programmers like to use a set of development programs that they are happy with. I used the Microsoft Macro Assembler, the Borland Turbo Linker, Degas Elite, and the Microsoft QuickBasic Editor. The assembler is slightly modified through a set of macros that allowed me to structure the code in a C-like block structure: this makes conversion to other processors much easier. Purists might say that this method does not produce the 'best' code — I disagree.

An example of the comic-book speech bubble interface used in Metropolis

The branches have to be made anyway, and it speeds up debugging, conversion, and development time. The modifications, although quite short, require several pages of explanation, so I won't go into them here. Other programs I found useful were Norton Utilities, and Borland's SideKick and Turbo C.

**'... the game hasn't changed too much from the original idea except that I didn't intend to spend quite so long writing it!'**

Using these development tools and only two machines, a Tandy 1000 and an Atari ST, I embarked upon coding my ideas. All the graphics in Metropolis were developed on the Atari ST and then uploaded onto the Tandy. I then converted the files into Tandy 1000 format (Listings 1 and 2 show the upload and download programs).

The final program consists of a small AI module, a speech synthesis module, a graphics environment manager, and an interactive news source. The whole thing fits into 256k

which, I am told, is quite impressive for a game of this complexity. Each of these modules fits together to form the game, and I'll examine each of the modules separately. (I assume that the reader has a little knowledge of programming in Basic, C, and 8086.)

## Programming

The Atari ST has, in my view, an odd screen format. The first four 16-bit words of screen RAM refer to the first physically-displayed 16 pixels.

To identify the colour of, say, the first pixel, combine bit 15 of each of the first four words to achieve a 4-bit number, and so on, for all 16 pixels. The process then starts again, combining 4-bit fourteens, and so on, until you reach bit 0 and pixel 15. The next four words then define pixels 16 to 31, and so on, for the entire memory map.

The Tandy 1000 has a much easier screen format. Instead of words the Tandy uses nibbles, so the top four bits of the first byte belong to pixel 0, and the bottom four bits to pixel 1.

The IBM CGA format is similar to the Tandy 1000, but you can only have four colours on the screen. Also, there are only two colour palettes from which to choose: either background, cyan, magenta, and white or background, red, green and yellow. The screen consists of two bit quantities.

The IBM EGA card is different again. To gain 16-colour 320x200 format, you have to address four planes of memory (the intensity

plane, the red plane, the green plane and the blue plane respectively). The most confusing aspect is that all the planes have the same memory address (A0000H), but IBM has solved this problem by giving the EGA card registers to select the read/write format, and so on. IBM has also made this card a 'hands off' graphics system, which means that technical information is very hard to come by.

### The AI module

The parser works on two levels. The first really goes to work on the sentence and forms a word list from the sentence; and the second level then tries to parse the sentence by looking at the words and filling in what you have really asked. If that achieves nothing, then the computer engages its 'idle chat' mode and comes up with a semi-intelligent reply or a helpful hint. Either way, the overall impression is that of intelligence (except to programmers).

All of the interaction in Metropolis stems from the book *Godel, Escher,*

*Bach* by Douglas R Hofstadter (very highly recommended), followed by its related text (which consists of about 20 years' worth of *Scientific American*, several obscure books and a Russian translation!).

**'This story builds up to reveal the fact that television companies are fighting a real war to attract the maximum number of viewers . . .'**

When you ask the computer a question in Metropolis, the machine response should at least be a grammatically correct answer and at best incorporate some relevant facts, based upon something relevant to the crime or just a flat guess at what

the sentence is about. To actually form the reply, the computer 'fleshes' up a sentence format with words that are listed in the related word library. A typical conversation, using both game and guess format, might read:

Player: Hello.  
Computer: Good afternoon, Sir.  
Player: Where the photon am I?  
Computer: I don't know where the photon you are. Do you fancy a cup of tea?  
Player: No, what's through this door?  
Computer: The green or red one?  
Player: Red.  
Computer: The supermarket.  
Player: My armadillo can ride a bicycle.  
Computer: But can it drive a Porsche?

If the user enters enough single words and small phrases, you can get away with fooling people into believing that something intelligent is at work — the biggest asset in convincing people that a computer is

talking to them is their own gullibility. Most people want to believe that computers really are capable of talking fluently. After all, didn't HAL look good in *2001 A Space Odyssey*, and how about WOPR in *War Games*?

The human mind has no way of knowing that I or any other person is intelligent. It relies on the fact that because I look human, I am intelligent. Therefore, the way you present the answer is also very important. Speech bubbles seemed natural to me, since people will associate these with comics and human scripts (look at *2000 A.D.* — talking robots everywhere!).

The game can store so much text by using something called Weighted Huffman coding. This relies on the unevenness of letter distribution in the English language and changes the amount of memory a particular character takes up accordingly. So, the letter e, which is the most frequently-used letter in the English language, takes only two bits of memory instead of the usual eight. This works very well on the text (and also protects it quite nicely, too), but it's too slow for the graphics. Given that the buildings in *Metropolis* are all of the vertical skyscraper variety, I decided to store the graphics as lengths of vertical, coloured lines. Overall, the compression squeezes files down by about 40%.

#### Speech synthesis

The speech synthesis uses digitised phonemes. Words are translated to their phonetic equivalent by using some simple rules. Those (many)

**'The whole thing fits into 256k, which, I am told, is quite impressive for a game of this complexity.'**

words that don't follow the rules are held in an exception dictionary that stores all the phonetic data for the word: for example, 'PCW' becomes 'PEE SEE DOUBLE YOU'. The IBM PC doesn't have a sound chip: it has something that I would call a tone generator (others might think of more appropriate names). However, you can 'click' the speaker to give the impression of volume. The machine I originally programmed *Metropolis* on, the Tandy 1000, has a fine sound chip, so the speech is fairly good on this format.

#### The graphics environment manager

All the characters in *Metropolis* use 16 frame-per-step animation which makes walking look quite smooth (this is similar to the animation used in feature-film cartoons). To add to the realism, the newscaster also moves her lips to the words. The graphics are all compressed using a bit strip method, which involves the well-trodden method of using a code

prefix.

The data takes the format:  
byte [ 0-127] add the next n bytes to graphic  
byte [128-255] add n-128 of byte+1 to graphic

For example:

db 5,1,2,3,4,5,170,0

expands out to:

db 1,2,3,4,5,42 dup(0) ; bytes 1,2,3,4,5 and 42 zeros

#### Putting it all together

As the jigsaw began to fall into place, demos were presented to Mastertronic, for a long time centring upon the graphics and speech; the actual gameplay followed much later (about June 1987). By this time, the game only worked on the Tandy 1000.

Conversions to other IBM formats followed, but various problems made this process quite difficult. CGA graphics are odd, to say the least, and the EGA format is ... well, horrible, and the Amstrad 1512 is worse. On top of all this are the various processor speeds to account for (the speech has to be timed extremely accurately).

In the end I used a dithering technique on the CGA to shade 16 colours using only four. This was slow, but by utilising vast tables the speed was made acceptable.

Finally, the instruction booklet was written. It took two months to decide who was going to write it, and four hours for me to write.

And so a game was born.

Graham Devine's *Metropolis* is reviewed in 'Screenplay' on page 162.

END

# JPI Modula-2

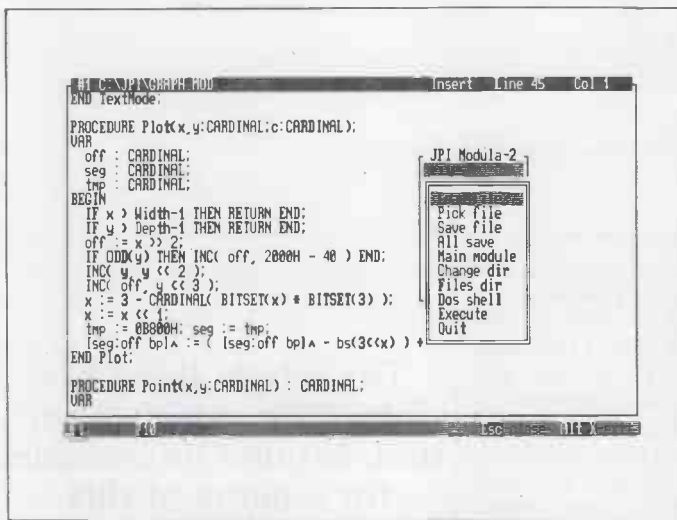

The reluctance of many programmers to tackle the idiosyncrasies of Modula-2 could turn to enthusiasm with the arrival of JPI's version — a fast, full-featured compiler for the IBM PC and compatibles. Owen Linderholm attempted to keep up with it.

Language freaks and hackers either love or hate Modula-2 — it's that sort of language. Some swear by it and, given the choice, would use nothing else. Others loathe it, and wouldn't use it even if the alternative was entering binary digits via a front panel. The two camps are split into those who prefer structured languages like Pascal, and those hackers who prefer assembly code but would use C if necessary.

The reasons for this split lie in the nature of the language, which stems directly from its original author and from its roots. Modula-2 was conceived as a successor to the original Modula and to Pascal. Both of these languages were created by the same man — Niklaus Wirth. Many people are familiar with Pascal, but Modula, on the other hand, is a rather obscure, experimental multi-programming language.

Modula-2 scores over Pascal in that the syntax has been heavily simplified; it has a module concept and a stricter structure; it includes processes for multi-programming low-level facilities and easy type conversion; and, finally, it uses procedure types so that procedures can be assigned to variables. The result is that Modula-2 is a very highly-structured language with powerful facilities. It is especially good at large projects involving low-level hardware facilities, such as operating systems, and is also ideal for any programming project involving more than one programmer.

The disadvantages involve typing '—' for variables or keyboards. Modula-2 is what is known as a 'strongly-typed' language, which means that every variable must be of a defined type and may only be referred to in a context where it is legal. Because of this, and the need to rigidly define variables, types, structures and procedures, Modula-2 is a

The JPI Modula-2 environment in standard use. Any of the open windows can be changed at will. All of the compiler commands are immediately available via the menus or direct keyboard shortcuts. Operation is swift, easy and efficient.

'wordy' language with long source code files. Many programmers find the extra finger exercise rather excessive.

Another contributing factor to Modula-2's unpopularity is that since it was developed with one machine in mind and later ported to others, it has a standard core but non-standard extensions to that core. Consequently, there are very few implementations of Modula-2 that are truly compatible, except at a basic level.

The version of Modula-2 reviewed here evolved from a product which was only partly developed but has been successfully launched by the well-known software giant, JPI. The program's ancestry shows to some extent, although JPI has rewritten it and added many interesting and novel ideas of its own.

## Commands & facilities

JPI Modula-2 only runs on the IBM and compatibles. It requires 512k of RAM and at least two floppy disk drives — preferably a hard disk.

JPI Modula-2 is a full implementation, with many extensions, of Modula-2 version 3 as defined by Wirth. However, the standard librar-

ies it has been installed for are *not* Wirth version 3. Instead, they are JPI's own libraries, modified to work well on the IBM PC and including many extensions. More surprisingly, they are not particularly similar to Wirth's suggested libraries, even though this would be easy to achieve. (A set of Wirth standard libraries is included with the program, but you have to instruct the compiler to use them.)

As an example, Wirth suggests that the command to read a cardinal (a positive integer) should be 'ReadCard(x)', where x is a variable defined as a cardinal and ReadCard is held in the library 'In Out'. Instead, JPI uses 'x:=RdCard', with RdCard as part of the library IO. These differences may seem small, but they can cause real headaches when converting from compiler to compiler.

The compiler is extremely fast. It can compile programs of up to 1Mbyte in code and data size, and generates standard .EXE files. Modules can be compiled separately and saved as object code to be linked later with other modules to create a complete program. This would be standard practice on a large project

with many people working on different parts of a large program. Libraries of modules are included with JPI Modula-2 to support I/O, string handling, DOS calls, mass storage, processes, concurrent programming, real maths with or without the 80x87 chips, graphics and windowing.

All these modules and libraries are monitored by a 'librarian' which automatically creates library files for every module, and helps the linker link in only the parts of each module that are needed.

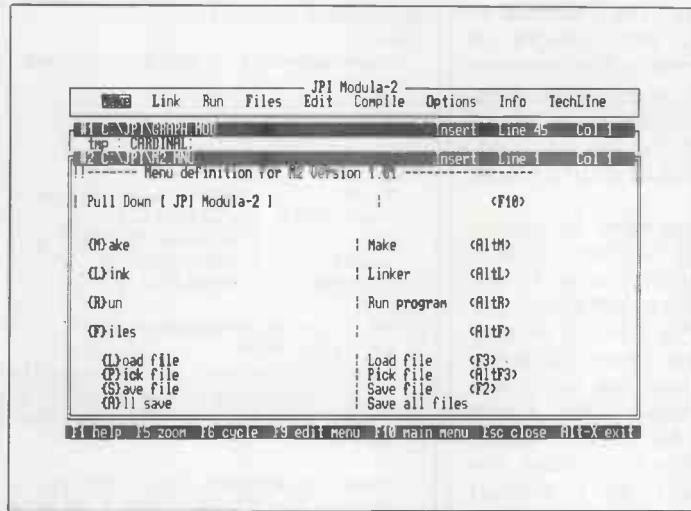

The compiler works from a windowing and menu-driven environment which is extraordinarily configurable — far more so than any other program I have seen. JPI Modula-2 can be invoked as a full compiler and/or linker from the DOS prompt as part of a batch command. More interesting, however, is the level of configurability of the environment. Each part of JPI Modula-2 appears in a window and each of these windows can be moved, recoloured, resized and even restyled. All changes are remembered and stored in a configuration file. These configuration files can be specially created, saved and reloaded under different names.

JPI Modula-2 contains a file called M2.MNU, which is a text file containing the order of menus, style of menus and keys used to invoke options throughout the environment (including the editor). If you want, the 'Quit' option can lead to the editor! I really like the idea that you could load this file into the JPI editor, change it and save it, so that the program was completely different the next time you ran it.

An item of interest on the main compiler menu is 'Techline'. It will only be relevant to those users with modems, but it allows you to call up a BBS system providing specialised support for JPI Modula-2. Essentially, Techline is a JPI and IBM PC-specific communications program. You dial up, and windows containing information and menus appear. You have to register first but, once this has been done, you can ask questions which will be replied to within a day or two, and you can browse through other questions and answers to see other people's solutions to problems. You can look at news to see what updates and new versions are available, as well as bug lists and fixes. You can also download sample JPI Modula-2 code to look at and run.

## Performance

The impression I got while working on JPI Modula-2 was one of power and speed, although when I examined the Benchmark and compile speed figures, I was a little surprised

An open editor window and the main menu. In the editor window is the M2.MNU file which allows the menu structure, appearance and keyboard controls to be altered. Notice that the menu differs from that in the screen shot alongside

at some of the results. In particular, the compiler is highly disk intensive while compiling a program, due to the language's modular nature. When compiling, module definitions have to be loaded in from disk for syntax checking; and, when linking, object files for the modules must be loaded in to slot together to make the final program.

Using the compiler from the environment is very pleasant. It is easy to configure to suit your idiosyncrasies and operates quickly. The editor can have up to five windows open at once (one reserved for editing compilation errors), making the process of entering and editing source code considerably easier. For example, repetitive bits of code that aren't suitable for compilation as separate modules can be copied from a program in one editor window to a new program in another window.

JPI Modula-2 takes care of closing and saving files automatically. In addition, when the compiler is started up, it automatically reloads all the editor files and window and configuration settings that were last in use. Short-cuts are available for all commands in the form of single and combination keystrokes.

Judging by the Benchmarks (see page 148), JPI Modula-2 performs fantastically well in one area especially — graphics. Not only is it faster than any of the comparable compilers, it is also the second fastest result we have ever obtained for the 'GrafScr' Benchmark! The only machine/language combination to achieve a faster rating was a Sun workstation running Sun C — just. All the other Benchmark results for JPI Modula-2 are impressive, too — well on a par with the fastest compilers from other software houses, and better than most. I have compared it with Turbo Pascal version 4, the fastest IBM compiler I know of, and Turbo C, since it is the only widely-accepted C compiler for which I have

figures running on comparable hardware. Turbo Pascal version 4 emerges as being slightly quicker to run and significantly quicker at compiling. Turbo C is about the same as JPI Modula-2.

One of the major criticisms of Modula-2 in comparison with C is that it produces less compact and slower code. This may have been true of previous Modula-2 compilers on the PC, but is definitely *not* true of JPI Modula-2. It produces more compact code which runs slightly more quickly than Turbo C, and produces it quicker — and Turbo C is just about the fastest C compiler around!

The new Microsoft C apparently produces extremely compact and fast code, but is certain to be a rather unwieldy monster compared with JPI Modula-2.

There *are* bugs in JPI Modula-2, but JPI doesn't hide this fact. It encourages the reporting of bugs and provides a list of the known ones on Techline. Those that have been fixed in the next version of the compiler are listed. New versions will be available at regular intervals for the cost of a stamped, addressed envelope.

## In use

Installing the compiler is quite straightforward — you copy the two disks for the compiler and the libraries to the hard disk and run the program. A third disk contains source code for the libraries, for those keen developers who want to customise them. Setting up double-floppy systems is also straightforward. I did encounter one serious problem, though. I transferred the two disks to a single 720k floppy for use in a portable at home. The program worked fine, but I didn't bother initially to make the compiler use drive B: for source and object files. Eventually, the 720k floppy filled up: when I tried to save my current file, I was informed that no more space was

available. I instructed the compiler to switch to drive B: and thought all was well. Unfortunately, the compiler still insisted that it save the file onto drive A: before moving on to drive B:. Nothing would change its mind, so I gave up and lost an hour's worth of editing.

The compiler was easy to use — so much so that it rivalled my previous favourite, Turbo Pascal 4. The environment is very different but even more extensive. I found writing code a chore at first since the libraries JPI uses by default are not in the standard Wirth format. After I had used the compiler for about a week, however, I was able to convert the syntax automatically as I entered code.

I rarely used the context-sensitive Help which is available, mainly because JPI Modula-2's operating environment is quite straightforward. I found it easier to use the manual and the example programs provided. You can view these in separate editor windows while entering your own program, to learn how to use JPI's libraries.

During the review period I wrote a couple of short test programs and started work on a large project. I found the process of debugging reasonably easy, since JPI Modula-2 uses the popular integrated development approach by returning you to the editor with syntax errors marked. It marks all errors in a file at once. When you then move the cursor through the source file in the editor, you get a separate message for each error as the cursor passes across it.

## Problems

I have already mentioned the major problems that I had, but I should also say that the compiler, when running programs from within the environment, was a bit shaky. I occasionally suffered from run-time errors (subsequently returning safely to the environment) that proved to be unrepeatable. However, JPI is willing to provide overnight solutions to prob-

```

PROCEDURE Statistics ;

      DEC(count) ;
    END ;
  END ;

```

A sample piece of JPI Modula-2 code. Note the non-standard library calls

lems, so this should give end users confidence.

## Documentation

The manual, a hefty 266-page paperback, is lucid and thorough, but inaccurate in several places. The inaccuracies are not serious, but can cause irritating delays. For example, the library MATHLIB is listed in different places as being 'MATHLIB' and 'Mathlib', the former being correct. Modula-2 differentiates between upper and lower case, and the confusion meant that I had to compile a program twice.

## Conclusion

Although JPI Modula-2 felt a bit 'pre-release' because of the inaccuracies

in the manual and the program's general 'flakiness', my overall impression was favourable. The support for the product from JPI is, frankly, fantastic — better than for any other software I have encountered and certainly on a par with Dell's hardware support. It is a fast, full-featured compiler and is continually being extended: for example, I was shown a preliminary symbolic debugger which will be released in the next few weeks. Toolboxes are also in the pipeline, especially for graphics. As the product attracts more support, the various bugs and minor problems will be ironed out.

Developers who want a serious compiler for the IBM PC, and who need the power of C but want a more structured alternative, should consider this compiler very carefully. Existing Modula-2 fans won't be able to resist — it's a great bargain.

Many of the facilities show the way towards what a development compiler *should* be like. Programmers have put up with sub-standard compilers for far too long: the main factor in my reluctance to use C is that there has never been a compiler available that I was prepared to use.

## Benchmarks

All timings were run on a Hewlett-Packard Vectra unless stated otherwise, and are in seconds.

	JPI Modula-2	Turbo C (1.0)	Turbo Pascal 4
IntMath	0.015	0.015	0.02
RealMath	1.2	1.5	0.8
TrigLog	10.25	10.60	12.75
TextScrn	28.9	41.5	26.25
GrafScrn	0.6	—	1.25
StoreHD	4.0	2.3	2.5

### Compile speed

Five hundred and forty eight lines of code using several different modules took 10.7 seconds to compile, including disk access to fetch the module definition files.

Excluding the disk access, compilation was about six seconds. This performance is rather slower than Turbo C and *much* slower than Turbo Pascal 4.

JPI Modula-2 costs £79.95 including VAT and is available from Jensen and Partners International Ltd, 63 Clerkenwell Road, London EC1M 5NP. Phone (0800) 444143 to order or (01) 253 4333 for general enquiries. **END**

# Abraca d'abacus.

## Psion Organiser II. The magic of PC power in your pocket.

You could be forgiven for thinking that the Psion Organiser II is just another hand-held programmable. Hand held, yes. Programmable, very much so. But just another? No way.

For a start, with plug-in Datapaks you can have up to 320k of memory at a time, giving around 280k for your own programs. Even without Datapaks you can now have a massive 32k RAM (Model XP). What's more, what's saved there stays there, even when you switch off... or change the battery.

You might think that, because it's small, Organiser II's programming language is just a token gesture. Wrong again. Combining the ease of Basic with the structure of 'C', it offers full integer, floating point, string, array, file-handling and machine code facilities. It has around 120 commands and functions, plus any you add

yourself. And it runs up to 10 times faster than Basic. You can of course program Organiser II direct. But you can also write your programs on a PC using our powerful Developer environment, and down-load them through our Comms Link (which incidentally also allows Organiser II to be linked to printers and modems as well as desk-tops).

You can also plug pre-programmed packs into Organiser II. Our Pocket Spreadsheet, for example, gives you all the major features of a PC spreadsheet and, with Comms Link, allows you to transfer Lotus 1-2-3\* type spreadsheets to and from your PC. There's a range of program packs to help you, from a Spelling Checker to a Formula Calculator.

And just in case all this isn't enough, Organiser II comes already programmed with a remind-you diary, a find-it-for-you filing system and address book, a clever calculator and a clock with eight hourly, daily or weekly alarms.

The price of all this power? For less than £100, including VAT. Psion Organiser II. It's fast. It's powerful. And it's available from leading retailers, including Alders, Dixons, House of Fraser, John Lewis, Laskys, R.S. Components, Ryman, Underwood and Wilding Office Equipment.

# Talking pictures

In the final part of our Teach Yourself Smalltalk series, Carl Phillips looks at the language's interactive programming environment, and presents a picture of how it looks on the screen.

One of the distinguishing characteristics of Smalltalk systems is their support for interactive bit-mapped graphics. The ability to create, manipulate, and display high-quality graphical images is a fundamental part of the system. The interactive Smalltalk programming environment and Smalltalk applications programs rely heavily on the graphics classes.

Since this series has referred to 'Smalltalk — the language' and not 'Smalltalk — the interactive programming environment' I haven't said much about what Smalltalk looks like on the screen. However, to appreciate the graphics classes built into Smalltalk, it is useful to see what a Smalltalk screen looks like. Shown on page 144 is a typical view: in this case, Digitalt's Smalltalk/V at work.

As on the Apple Macintosh, work is performed in overlapping windows which are manipulated using the mouse. These windows are further sub-divided into different areas called 'panes'. Entering, editing, and compiling Smalltalk code is done in specialised multi-paned windows called 'browsers'. Applications that run within the Smalltalk environment usually provide their own specialised windows or browsers which reflect their use. For example, one simple application that comes with Smalltalk systems is the 'Form Editor' (a 'Form' is the Smalltalk name for a bitmap). This displays a window which lets the user create and edit bitmaps in a similar way to MacPaint on the Mac.

Xerox Smalltalk was the first bit-mapped windowing system — the Apple Macintosh, Microsoft Windows and GEM subsequently borrowed these ideas. Dan Ingalls, one of the original Xerox researchers who created Smalltalk-80, is credited with inventing the — now famous — 'bit block transfer' or 'BitBLT' graphics operation (bit block transfer was the name of an instruction on one of the

Xerox research computers). BitBLT is a single underlying graphics primitive which can support all screen operations on a bit-mapped screen. It became famous as the operation at the heart of the windowing systems provided by the Apple Macintosh ROM toolkit, Microsoft Windows and GEM. Some modern personal computers such as the Commodore Amiga have a hardware BitBlit where the operation uses custom hardware to speed things up.

Of the three Smalltalk dialects discussed so far, Xerox Smalltalk-80 and Digitalt's Smalltalk/V both support a rich set of graphics functions. Little Smalltalk currently only provides a simple 'turtle graphics' library which reflects its origins on Unix systems. Little Smalltalk can have windows and BitBLT-style operations added if the underlying operating system or hardware supports it.

## BitBLT

BitBLT operations appear directly in Smalltalk as a named class 'BitBlit'. An object of class BitBlit represents a movement of bits from one place to another, possibly with a transformation taking place during the movement, and with a number of parameters (such as clipRect, which limits the rectangle of bits affected in the destination).

BitBlit is an interesting example of how objects can represent what is normally thought of as a pure procedure. It is possible to create a BitBlit object as usual by sending the class BitBlit a message requesting a new instance of a BitBlit object. The object returned can then be sent various messages that set the parameters for the BitBLT operation.

The message 'copyBits' sent to a BitBLT object will actually perform the fundamental operation associated with BitBlits — moving bytes from place to place with certain transformations (governed by the pa-

rameters) taking place during the transfer. The benefits of representing BitBLTs as objects rather than, say, having a 'BitBLT' message to a bitmap object include simplicity and flexibility. After having performed one 'copyBits' operation, it is easy to change one or two parameters and send 'copyBits' again to the same BitBLT object, leaving the rest of the parameters the same. Common screen update tasks and animation are performed efficiently in this way.

## Forms and pens

As well as BitBlit, Smalltalk has several other classes associated with

graphics. Objects of class 'Form' are bitmapped images consisting of an array of words that hold the raw bitmap data plus the height and width of the bitmap image. Form objects can provide the source and destination objects for BitBlt transfers.

The display screen is usually a Form object in Smalltalk as a Form (or an object of class DisplayScreen which is a specialised subclass of Form). Note that the graphics operations can use any form for the destination — there is no need for all graphics to appear on the screen.

Class Pen gives Smalltalk the 'turtle graphics' facilities made famous

in the programming language Logo. 'Pens' are a subclass of BitBlt that have some additional state and methods, and take the form of a brush or a nib, as well as a position, direction and state (whether the pen is up or down). Pens respond to messages sending their colour, their position, direction, and state.

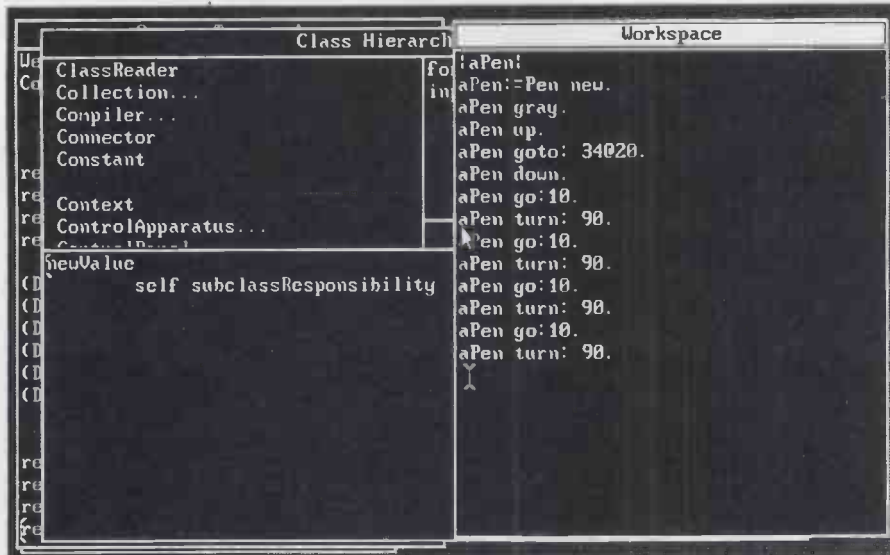

Class CharacterScanner is a subclass of Class BitBlt that allows the easy manipulation and display of characters onscreen. Objects that are instances of class CharacterScanner are BitBlt, such as 'procedural' objects that will convert strings of ASCII characters to a bitmap source image

which can then be transferred to the screen. Among other things CharacterScanners have a font object associated with them that governs the appearance of each displayed character. CharacterScanners respond to the message 'display:at:' to actually display a string as the message 'copyBits' is used with BitBlts.

These graphic objects are created and manipulated using simple Smalltalk statements, just like any other kind of Smalltalk object.

For example, the ST/V statements:

```
|aForm|
aForm := Form fromUser.
```

A typical Digitalk Smalltalk/V screen showing turtle graphics commands being entered directly into the workspace window

aForm displayAt: 34@20

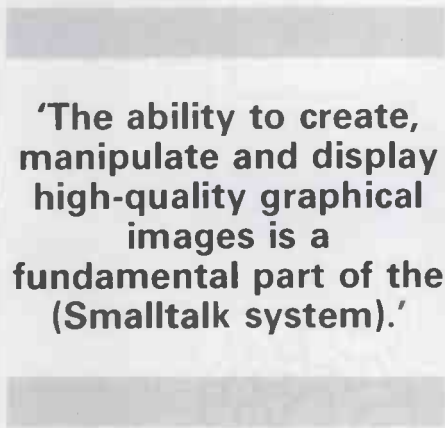

will ask the user to appoint a rectangular area of the screen using the mouse, copy that area to aForm, and then redisplay the saved form at a particular location — the point object 34@20.

The message 'fromUser' is a class message — sent to the class Form and not to an instance of Form. The method that implements the 'fromUser' message will use a BitBLT operation to transfer the bitmap the user designates from the screen to a newly created form and return that form object. This form is assigned to the temporary variable aForm which is sent the message 'displayAt:' with a single argument — the point object 34@20. The method in Class Form that implements the response of form objects to the 'displayAt:' message will create and execute a new BitBit object that copies the source form (in this case aForm) to the destination form — in this case the display screen — at the point 34@20.

As the above example demonstrates, by making use of the classes supplied with Smalltalk, very high-level graphics operations can be performed in just a few statements. Graphics operations with Pen objects are easy too:

```
aPen |
aPen:=Pen new.
aPen grey.
aPen goto: 34@20.
aPen down.
aPen go: 10.
aPen turn: 90.
aPen go: 10.
aPen turn: 90.
aPen go: 10.
aPen turn: 90.
aPen go: 10.
```

will draw a grey rectangle on the screen beginning at point 34@20. These statements create a new inst-

**'The ability to create, manipulate and display high-quality graphical images is a fundamental part of the (Smalltalk system).'**

ance of class Pen, send a message to aPen setting its colour to grey, send a message settings its position to the

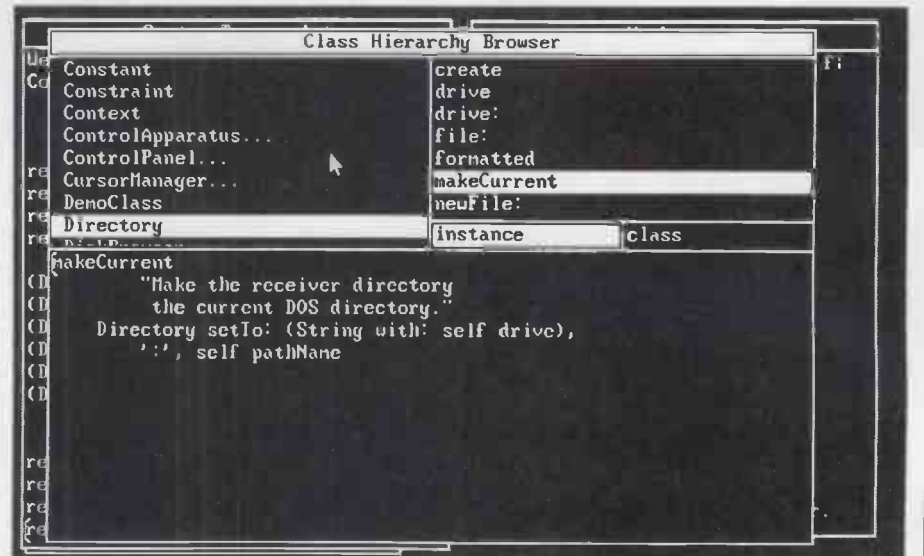

object 34@220, send a message setting its state to down, and then a series of messages commanding it to move about the screen drawing the rectangle.

These graphic classes provide the underlying basis for the Smalltalk user interface. Coupled with the Smalltalk user interface classes they provide the elements for building serious applications programs.

## Interface classes

Software systems, such as the Apple Macintosh toolbox, Microsoft Windows, or GEM, provide a library of routines that can be called from an application program to provide a graphical interface. In Smalltalk, the standard user interface is provided in a set of classes. There is no distinction between an application program, operating system, or window manager in Smalltalk; they all live and cooperate in the single integrated Smalltalk environment, so the user interface classes that you use in building Smalltalk applications programs also support the browsers and windows that are used to implement Smalltalk.

By reusing these standard classes built into Smalltalk in the creation of an application program you can save yourself a lot of work. There are many predefined building block user interface classes that support the facilities built into Smalltalk. By directly creating and using instances of these classes or by subclassing to change their behaviour as required, you build on what has been done before rather than reinvent the wheel. Since representing everything as an object is a powerful abstraction you can re-use both high and low-level objects in your work. If, for example, part of your application needs to create and edit bitmap images,

The Class Hierarchy Browser gives access to an important feature of Smalltalk: the ability to manipulate and create your own classes

*Whatever your hardware  
Think . . .*  
**Smalltalk-80**

Smalltalk-80's unique virtual image remains the same across IBM PC AT, Sun, Apollo & Xerox hardware placing no restrictions on application development or delivery hardware choices. In fact, applications written in Smalltalk-80, however large or graphical, can be ported across different hardware in a matter of hours.

Whatever application you have in mind, Smalltalk-80 is ideal for exploratory programming and AI simulation work. Its power and productivity is derived from the pure, object-oriented approach, applied uniformly throughout the system. Smalltalk-80 makes highly reusable code a reality. An added bonus is the availability of system source code, enabling the user to extend and adapt the basic system.

For further details on Smalltalk-80 or the NEW COLOUR VERSION (Smalltalk AT) on PC's, call Helen Roy on (0923) 247707 or return the coupon below.

you can just re-use the classes that make up the Form Editor directly.

This is in sharp contrast to the window manager systems on the Macintosh or Microsoft Windows. While these provide low-level building blocks of varying degrees of utility, there is no easy way to re-use higher level abstractions.

## Model-View-Controller

Xerox Smalltalk-80 uses a system called 'Model-View-Controller' (usually abbreviated to MVC) to provide a high-quality user interface. Digitalk's Smalltalk-V has a roughly parallel but simpler set of classes and uses different terminology — application-pane-dispatcher rather than model-view-controller. This explanation will use the Smalltalk terminology but the fundamental ideas remain the same. One problem with Model-View-Controller is that up until recently it had not been very well documented anywhere. Xerox and Addison-Wesley have published a series of three books about Smalltalk-80 but the fourth book about using Model-View-Controller was announced but never materialised. This means that MVC has acquired an unjustified reputation for being difficult to use and understand.

Many people who supply Smalltalk systems publish applications notes or papers that describe how to use Model-View-Controller, but it still remains a stumbling block for novice Smalltalk programmers. Source code for the MVC classes is provided with Smalltalk and using the browser to look at the Model-View-Controller class source code and see how the existing Smalltalk tools make use of them is a good way to learn about the MVC classes.

Model-View-Controller divides an application up into three elements: the 'Model', the 'View' and the 'Controller'. For most applications only the model will require extensive programming. The View and Controller elements are created by re-using classes from the View or Controller class hierarchy.

The 'Model' is the object that represents the application being displayed or viewed. Any Smalltalk object can act as the model — until recently there was no class Model defined in Xerox Smalltalk — which was the source of some confusion. All the objects care about is that the object being used as the model can understand the messages that they send to it and that the results are intelligible to them. The messages that provide these links between Models, Views and Controllers and the message protocol that is assumed are implemented in Class Object — so 'all objects understand them.

A 'View' provides a visual picture or view of some part of the model. There can be multiple views of the same object or different parts of the object. At the top of the class hierarchy for Smalltalk view objects is the Class View. Other views are subclasses of View that get more and more specialised but perform more useful functions for the user. Some examples are BinaryChoiceView which displays a view giving a choice between two different options, FormView which provides a view onto a form object, and TextView which provides a view of formatted text. (Smalltalk/V uses slightly different names for some of these classes.)

A 'Controller' handles the interaction between the application and the user — the interface with the keyboard, mouse or other peripheral devices. As with Views, Smalltalk provides a set of different Controller classes which can be re-used in an application. At the top of the hierarchy is class Controller which implements the messages all controllers have to understand. Other controllers include: BinaryChoiceControllers, which let a user choose between two different options; MouseMenuController, which handles the interaction with a pop-up menu controlled by a mouse; ParagraphEditor, which is a controller that allows the input of formatted text; and ListController, which lets the user choose between

items displayed on the screen.

Class StandardSystemController is the standard controller for a Smalltalk window. It handles all the interactions that allow a window to be displayed, moved, have its size altered, and so on.

The objects that represent the model, one or more views, and one or more controllers are linked together through a dependency chain. This is a mechanism by which Smalltalk objects can communicate changes in their internal state to other interested objects. Whenever the state of an object changes, it can send itself a 'self changed' or similar message. The implementation of this message sends further messages to the objects that are dependent on that object. This is a powerful but simple mechanism. There are a number of messages provided in class Object that enhance the basic dependency mechanism by allowing an object to broadcast messages to all interested objects at once, or to alter the update mechanism to improve efficiency.

For example, suppose we have an object that stores a number, and a simple object that provides a view onto that number. Whenever the value of the number changes, the view object will get a message saying its model has changed its value. The View object can then ask the model object its new value and display the result on the screen. If a user points at the view on the screen and changes the number, the controller object can be used to notify the view and model to accept a new input value.

## The constraint system browser

By putting the simple network constraint system described last month ('Class system', PCW, February) together with the Smalltalk graphics and user interface classes, it is possible to create an interactive application program — the constraint browser. This will allow the graphical display and input of constraint networks created using last month's programs.

To do this we can make use of a number of the standard building block classes from the View and Controller class hierarchies. An instance of Class Network would represent the model. A custom subclass of one of the view classes will provide a view onto the displayed network and a controller subclass will let the user point at the displayed network and make changes. Such applications can be built incrementally: having created the constraint Network classes and tested them using Smalltalk applications, we can now re-use them in an interactive application. **END**

### Homework

- Investigate the Smalltalk graphics classes.
- Can you use Class Pen and Class Rectangle to create a class of Rectangle that knows how to display itself onscreen?
- How about using BitBlt instead of Class Pen to do the same job?

### Smalltalk is cheap

PCW has negotiated a special deal with Smalltalk Express which will enable our readers to follow the 'Teach Yourself Smalltalk' series at a reasonable cost.

For owners of an IBM compatible, an Acorn Archimedes or an Atari ST, Little Smalltalk is available for £7.50 for the disk and minimal documentation, or £32.50 including the book *Little Smalltalk*.

Smalltalk/V, the highly recommended graphical Smalltalk programming environment for IBM compatibles with at least 512k of RAM and two floppy disk drives, is available for £135 including full documentation. A free copy of Little Smalltalk will also be supplied with Smalltalk/V.

All prices are fully inclusive of VAT and postage & packing. Cheques should be made payable to 'Smalltalk Express' and addressed to: Smalltalk Express, Hyde House, The Hyde, Edgware, London NW9 6LA.

# Stop Press

**Stop Press is the latest addition to the collection of desktop publishing packages available for the Amstrad PCW and is ideal for the 'amateur' publisher. At a fraction of the cost of big DTP packages, Ross Blackman considers it fantastic value for money.**

It's astounding what programmers are capable of when presented with severely limited resources. The Amstrad PCW has — at best — no more than a few tens of kilobytes of usable RAM (discounting its RAM disk), runs under the outdated and much-maligned 8-bit CP/M operating system, and has a tortoise-rated 4MHz clock. But the vast user base has tempted software houses to squeeze every last drop of power from the machine, and the result is that they have made it do things which even Amstrad could not have dreamed of when the company first conceived it.

Nowhere is this more true than in the area of desktop publishing. For over a year the PCW market supported two competing packages (Fleet Street Editor Plus and Newsdesk International). They were joined a few months ago by the blandly named Desktop Publisher, which is also selling well. These programs offer a range of facilities at least comparable with those available for 'big' systems — graphics, a range of fonts and type enhancements, columnar output, incorporation of digitised images, mouse control, and all the paraphernalia of a WIMP environment. When you see them in action, it's difficult to believe that they're being driven by an antiquated 8-bit processor.

Of course, the screen resolution of the PCW can't be compared with that of the Macintosh, let alone the resolution of specialised graphics monitors for 16- and 32-bit machines. And since no desktop publishing package available for the PCW is designed to drive anything but the dedicated printer, the final output can't be placed in the same category as the professional quality available from a laserised machine.

But for many purposes, high-resolution screens are a luxury. And

let's face it: not everyone needs to produce laser-quality output. For local newsletters, menus, personalised greetings cards, notices, business reports, invoices, and so on, a dot-matrix is often perfectly adequate.

What's more, the price of desktop publishing software for the PCW is kept way down because of market expectations. It falls into the same kind of price bracket as that of the cable required to link an IBM PC to a laser printer. For less than the cost of a desktop publishing program running on a 16-bit machine, you can buy a complete PCW system — the micro with monitor and disk drive, printer, mouse and interface, and software.

## Design

Stop Press, from Advanced Memory Systems, is the latest addition to the PCW desktop publishing collection.

The package started life on the BBC Micro, and was then produced in versions for other machines. But good as it was on them, it could not simply be converted to PCW format as it stood — it had to offer more in order to stand a chance of survival in

the fiercely competitive PCW marketplace. The result is that it is just about the state of the art in 8-bit desktop publishing, offering several facilities lacking in the competition, and a user interface which differs fundamentally from its three PCW rivals.

The most obvious difference is that Stop Press does not use pull-down menus. Instead, it presents a single control panel containing a veritable multitude of icons, to which you can return at any time and from which nearly all operations can be performed. This makes the initial learning curve somewhat flatter — at least, it did in my case. Once I mastered the panel, however, I realised that it's a more efficient method of control than pull-down menus because everything is in one place.

The control panel is divided into columns, each representing a particular type of operation: filing, pasting, text, graphics, and such like. A second level of control is also provided by various windows and dialogue boxes accessed from the panel. These are concerned with actions like loading and saving files,

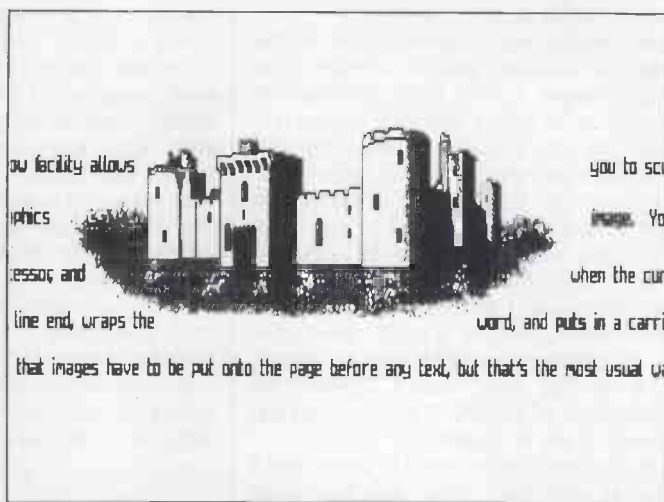

The Stop Press text editing screen. The currently available tools are arranged along the bottom of the screen, although the main control panel is more complex. The current document displays some of the typefaces available

A font editor allows for the resident typefaces to be modified or new ones created. A little experimentation will soon make the user aware how difficult improvement can be

Clip-art files are provided, and Stop Press can be instructed to flow around the jagged edges of an illustration

adding graphics patterns to a temporary clipboard, viewing a complete A4 page (as opposed to the square window on that page represented by the screen, called the canvas in Stop Press parlance), adjusting the size and shape of characters, and other nitty-gritty activities which require a user interface beyond that of the panel.

You can access the panel, windows and boxes either via the keyboard or using a mouse connected to an interface which plugs into the 50-way edge connector at the back of the PCW. The program will accept either an AMS or a Kempston mouse, and the interfaces for both will pass on the edge connector, so you can piggy-back a serial port or whatever onto it and leave them all permanently in place.

I wouldn't recommend using Stop Press without a mouse — the front end has been designed throughout with the little beast in mind, and you'll require bags of patience if you choose not to use one. Moving the canvas around a page, rubber-banding a box, or pasting in a previously saved picture is far easier when the cursor can be moved quickly and smoothly from one part of the screen to another.

Having said that, keyboard control is occasionally necessary for fine drawing work, and some people may find it easier to access the control panel using the keys. This is made practicable by an alphanumeric grid reference for each cell of the panel: for example, to access the ellipse icon you would simply enter G5.

When the panel is not displayed, the screen initially consists of a horizontal and a vertical line, the point at which they cross acting as a hair cursor. The lines are used to create boxes for all block operations, such as pasting in illustrations, and to de-

fine specific areas of the screen within which you wish to work without affecting the rest of your page. This is particularly useful when drawing free-hand, since you're then most likely to make mistakes and ruin something which took you ages to create and which you forgot to save.

As with all PCW desktop publishing packages, one page is held in memory at any one time. And, as you build it up, you can preview its overall effect by calling up a page-access window which overlays the canvas and displays the complete A4 page in miniature.

A moveable square box within the page-access window allows you to jump instantly to any part of the page. It's also possible to move the screen around the A4 page in real time, but the screen refresh then becomes very slow while the PCW works its little heart out to process kilobytes of constantly changing data.

Text entry is kept quite separate from graphics mode, but once a pixel has been lit on the screen, text and graphics are treated identically by the program. This is an advantage because it's possible to cut out a section of the screen whatever it contains, and save it to a file for later use or move it immediately to a different part of the page.

## Graphics

The program comes with a library of graphic cut-outs (clip-art), and an impressive collection of ready-made patterns and shapes, both solid and hollow. Any pattern can be temporarily loaded into the clip-board for fast access, then easily 'dropped' into the relevant area of the screen.

If you own a twin-drive PCW, the graphics and other demonstration files (there are plenty of them to mess around with) can be held in

drive B, while drive A holds your data disk. The system disk is no longer required once the program has loaded into the RAM drive, but since a page consumes about one third of the 170k of space available on an 8256 disk, you need to keep plenty of formatted disks handy (there's no way of formatting them from within the program).

The graphics tools supplied, not unexpectedly given AMS's long involvement in painting programs, are very good. You can do just about anything from spraying large areas with patterns to zooming into a particular area of the screen and changing individual pixels, from cutting, copying, pasting and rotating to automatically putting a border round a page.

There's a grid option for delicate drawing, which sets the hair cursor to move only by a given number of pixels. And a particularly welcome feature is a mouse lock: by holding down the X or the Y key while using the mouse, the cursor will only move horizontally or vertically — the perfect answer to drawing straight lines with a shaky hand.

Shapes are drawn by selecting one from the control panel, then rubber-banding a dotted box containing it. The range of shapes provided is not enormous, but with judicious use of what's there, plus other ready-made effects such as dotted lines and 'ghosting' (a light-grey effect achieved by superimposing one image on another), there's no limit to what you can paint (all in monochrome, of course, but AMS can hardly be blamed for that).

3-D effects with hollow shapes can be produced using a special tool which blanks out hidden lines in perspective drawings. The process is fiddly, but the facility will no doubt be very useful for publishing the re-

sults of CAD applications.

An important graphics tool is the scanner option, which allows digitised images (taken from a video recorder or a video camera) to be entered into a canvas. A video digitiser is of course required, and some people may feel that the total extra cost of incorporating digitised images negates the whole purpose of using an inexpensive PCW set-up for desktop publishing. But there's nothing like a photograph to give a club newsletter or a poster a professional touch, even if the final result, given the limitations of the PCW printer, is best viewed from a distance.

A graphics effect which deserves a special mention is a slip-and-slide routine for re-positioning areas of the screen with pixel accuracy. The normal copy function will achieve the same effect, as it does in the other PCW desktop publishing packages, but less accurately unless you're very lucky or have a lot of patience.

On top of all that, AMS has provided a further graphics tool clearly intended to set the program apart from the competition: a graphing facility called Easigraph. A straightforward data-entry screen allows you to input numeric data for the Y axis, and textual or numeric data for the X axis. A graph, bar graph or pie chart is then produced from it, in whatever horizontal or vertical dimensions you desire, on any part of the canvas. It's not as powerful as dedicated graphing facilities available for the PCW, but it's just the kind of thing needed for business reports.

## Working with text

Text can be input directly from the keyboard or loaded from a word-processed file (including LocoScript 1 and 2 files, with the enhancements preserved).

A variety of off-the-shelf fonts is provided (including one meant specifically for headlines), and these can be presented in any of 18 point sizes and a range of horizontal and vertical spacings (including proportional spacing and kerning). Alternatively, you can design your own typestyles with the built-in font editor — though I wouldn't advise starting a font from scratch (I did, and the result was atrocious). Far better to take one of the existing fonts and alter it.

Two fonts can be held in memory at the same time, and either can be selected at will, though one of them must be the standard Amstrad typeface (the one used by LocoScript). Each font can be output in bold, italics and reverse video, and can also be underlined and superimposed on a graphics pattern.

Text can be set in up to nine columns, justified or ragged at either

margin, and centred if required, though these text-formatting functions are more difficult to use than with most word processors. For this reason, particularly if you're dealing with large amounts of text, it is better to use LocoScript or some other text editor to create files before loading Stop Press, design and create the graphics, then read in the text at the appropriate points on the page.

A special entry routine is used for text, but once it is on the screen, it can be subjected to all the effects available in graphics mode. You can rotate it, stretch it, compress it, enlarge it... whatever.

**'If you own a PCW 8000 series machine, and haven't yet bought a desktop publishing package, I can strongly recommend Stop Press.'**

And, best of all, you can make it 'flow'. This is not an Artificial Intelligence application to help with structured creative writing, but a method of treating text almost as if it were a liquid moving around an object. Whenever the text meets an obstacle, such as a graphics image or simply a line, it assumes that it has reached a margin and wraps the next word. So, by drawing a diagonal line, you can produce triangular wedges of text. Or, if the obstacle is irregular in shape, the effect will be that the margins of the text take on (roughly) that irregularity.

## Documentation

Stop Press is so jam-packed with features that it takes 158 dense pages to describe them. This will not astonish those who have spent weeks ploughing through the manuals of big-system desktop publishing packages running to several volumes, but documentation of this length and complexity is rare in PCW circles. And it could have been longer if more space had been devoted to the tutorial section.

This is my one complaint. The quick 'getting started' introduction tells you almost nothing about the package, and when you know little more than how to click on an icon and load an example file, you're plunged into the reference section.

It's no good being reminded that you really ought to read through entire sections of the documentation and absorb everything before you

begin — human nature doesn't work like that. And, in any case, whose memory would be up to such a task? So, in practice, I discovered that learning to use the package often came down to a matter of trial and error, awful mistakes, and flicking through the manual to find the section which would guide me.

However, once you have created a satisfactory page or two (be warned — this can be a long process), you get to know where to look when all else fails. And the manual does have its plus points: there's a useful section on worked examples and hints (though I found that these are better left until you understand why you're doing what you're doing), and an advanced user guide which is full of goodies for adventurous souls.

The index is poor, but this is offset by the contents pages which are very detailed. There are two appendices: one being a glossary of terms, and the other a well set-out section on trouble-shooting.

## Conclusion

Stop Press is not as powerful as the Venturas or the GEMs of this world, nor does it rival its bigger brother from the same AMS stable, Finesse. But for many purposes it will prove equally useful, and it does have what many would consider to be the advantage of not being cluttered up with features you might only use once in a blue moon.

Stop Press is priced a little higher than its immediate competition, but then it offers more, and handy additions they are too — the 3-D facility, the slip-and-slide windows, Easigraph, and so on. In any case, £50 can hardly be called exorbitant for a relatively sophisticated piece of software, clearly the result of hundreds if not thousands of man-hours of planning, design and coding. What's more, the all-in price of £89.99 for the software, an AMS Mark 3 mouse and mouse interface, has to be excellent value for money.

If you already own a PCW 8000 series machine, and haven't yet bought a desktop publishing package, I can strongly recommend Stop Press. And if you're thinking about doing some amateur desktop publishing but are at present machineless, it's certainly worth buying a PCW and Stop Press for the purpose. You'll not get everything a 16- or 32-bit processor can offer, nor the kind of quality output provided by a laser printer. But if all you need is something which takes you into the world of fancy fonts and graphics without having to starve for a month, the PCW/Stop Press combination is it.

Advanced Memory Systems is on (0925) 413501.

END

# "£229 for all that?"

"Yes, it's the very latest, the industry compatible Multi-font LC-10 from Star, there are features included as standard not found on printers sometimes twice the price..."

"Well, there's the Star front control panel – so you don't have to fiddle with DIP switches –

a built-in push tractor for low form tear-off.

And you don't even have to take the tractor paper out to autoloading single sheets with the LC-10's paper parking. There's a large 4K buffer – it's even got six NLQ fonts as standard. It prints at a realistic 120 cps and has a really fast NLQ at 30 cps".

"Hey, that sounds good, but what about quality? You'd have to go a long way to beat the print quality on that NL-10 you've got".

"True, but they've even improved on that and you can change all the resident fonts at the touch of a button".

"Hmm, that's really easy – £229 for all that? I wonder if my dealer will have any left..."

"What's this – a new printer?"

"Oh really – like what?"

Where would you find lost charms, more gimmicks than you can handle, and a bunch of treacherous acolytes? In this month's pick of the best games, bravely tackled by Stephen Applebaum.

## Animal magnetism

**Title:** Jinxter  
**Computer:** Atari ST; Amiga  
**Supplier:** Rainbird  
**Format:** Disk  
**Price:** £24.95

Will Magnetic Scrolls never put a foot wrong? After the runaway success of *The Pawn* and *The Guild of Thieves*, you would have thought that the company might have run out of inspiration.

But if its competitors were hoping that its latest game, *Jinxter*, was going to be the one where everything started to go wrong, they must be mortified. Far from being a step backwards, *Jinxter* is, incredibly, an improvement on its predecessors.

*Jinxter* is a humorous tale about strange goings-on in Aquitania, a mythical world full of bureaucrats and statisticians. Unfortunately for the people of Aquitania, the magical charm bracelet, bequeathed to them by the magician, Turani, and which brought them perpetual good luck, has had its charms stolen. Without its charms, the bracelet is useless, and Aquitania is helpless against the ill offices of the green witches and their evil leader, Jannedor.

Your objective is to recover the various charms and reassemble the bracelet, thus restoring its magic properties. You must then use the bracelet's power to defeat the noxious green witches.

If this *sounds* simple, it isn't. While the bracelet is without its charms, its magic gradually diminishes, causing you to have increasingly bad luck. *Jinxter* is unusual, therefore, in that it gets progressively more difficult the further you go.

Although a number of items which appear in the adventure could be mistaken for part of the bracelet, Magnetic Scrolls has prevented any possibility of this happening by including pictures of the charms on the packaging and in the title screen, as well as informing you what they are

in the Infocom-like bump included with the game disk. However, apart from making the charms easier to identify, this does not help you find them.

All the charms have magic spells attached to them, which can be cast by saying the name of the charm. The spells include ones to make it rain, to make the sun come out, and to make things come to life. Each one of these comes in useful at some point, no doubt, though I have yet to discover where.

Throughout the adventure, you are watched over by a benevolent spirit called Len Wosname. He is one of the 'Guardians', whose job it was to protect the bracelet. Wosname, like all Guardians, cannot express his thoughts in words, and continually calls things by the wrong names. When he talks about the charms, for instance, he rambles on about the 'thingy' (dragon), the 'doodah' (fire engine), the 'oojimy' (walrus) and the 'doofer' (pelican).

A short insight into Wosname's speech appears in a phoney newspaper supplied with the game. Apart from being fairly amusing, this rag contains numerous clues and ciphered hints which can be keyed in and deciphered when things get really rough.

Humorous dialogue has always been a feature of Magnetic Scrolls' adventures, but in *Jinxter* the writers have gone overboard. When Wosname introduces himself, he does so in a way that reads like a snippet from *Monty Python*: "You wouldn't

believe I was an Immortal, would you?' he says. 'You wouldn't look at me and say: "Stone me, a bleeding immortal being, God-like in his majesty"?'

Inspecting a wall for clues produces a rather sarcastic reply, which takes up the best part of a screen, and ends: 'Thinking on the role of walls in your life, you eventually enter a trance-like state which the mystics of the Orient call "Nirvana" and the rest of us call "idiocy".'

Amusing as much of this is, the constant stream of rather laboured jokes eventually becomes rather tedious, and you begin to wish that the program's writers had not been such a happy bunch.

Like the Kerovnian adventures, *Jinxter* contains many superb graphic illustrations designed to complement the rich prose. These are far better than those in either *The Pawn* or *The Guild of Thieves*, which is quite an achievement. Only the first picture, depicting the inside of a crowded bus, lets the graphics down, simply because the passengers look like zombies. Then again, perhaps that was the artist's intention.

Magnetic Scrolls, like Infocom, hides its game disks among a mass of bits and pieces which, for some reason, are considered terribly important. Games companies seem to assume that their adventures are incomplete if they don't provide some useless free gift which most people probably discard soon after they have opened the package.

With *Jinxter*, then, you get a copy

of *The Independent Guardian* newspaper, a beer mat, and an enveloped memo containing an outline of the story. I was pleased with this last item — it replaces the turgid novella which Magnetic Scrolls usually includes with its adventures. We should be thankful for small mercies, I suppose.

As well as excellent graphics, Amiga owners are treated to an opening tune on their version of *Jinxter*, a swirling piece of fairground music. Sadly, the Atari version of the game is a non-musical affair.

*Jinxter* is the natural successor to *The Pawn* and *The Guild of Thieves*. I am pleased to see that Magnetic Scrolls has not rested on its laurels. It would have been easy for the company to produce an inferior program and counter-attack by challenging people to write a better program than either of the aforementioned two. But it has not done this. Instead, it has produced an adventure that sparkles on every level. Once again, I look forward to Magnetic Scrolls' next production.

## Killing time

**Title:** Trust & Betrayal: The Legacy of Siboot

**Computer:** Macintosh

**Supplier:** Mirrorsoft

**Format:** Disk

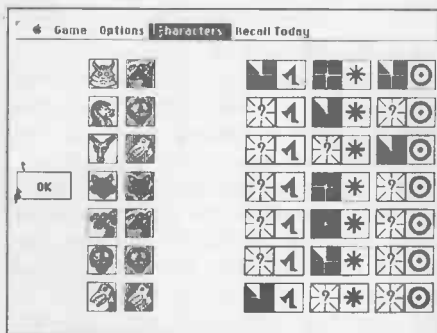

**Price:** Not fixed at press time

Chris Crawford's work is nothing if not original. His previous venture, the controversial *Balance of Power*, was an intelligent and thought-provoking blend of politics and military strategy based on contemporary world fear of nuclear war. *Trust & Betrayal* is far removed from that concept, but it is equally controversial since it portrays, as a virtue, man's ability to betray his 'friends'.

However, to make the whole thing more palatable, Crawford has dissociated the game's action from our everyday experience by locating it in an alien environment, inhabited by grotesque creatures which look like exiles from *Alice in Wonderland*. But the appearance of these creatures is an all-too-thin disguise; they are people, just like you and me, with loves and hates, conceits and affections, fears and aspirations.

Although their personalities are quite different, all these beasties are striving for the same thing — and to get it they will stop at nothing. Their forte is back-stabbing.

The scene, then, is Kira, a moon of the planet Lamina. Kira is a spiritual centre, inhabited by creatures who communicate telepathically. The moon's spiritual leader, known as the

Shepard, has died, and a new leader must be appointed before Kira society falls into chaos.

Seven acolytes, of which you play one, are in line for the Shepardship. To be admitted to the office, an acolyte must have mastered to perfection the art of telepathy. But, as usual, there is a catch: there are three forms of telepathy, each of which is made up of eight 'auras'. Perfection is achieved only when all eight auras of each category of telepathy have been collected.

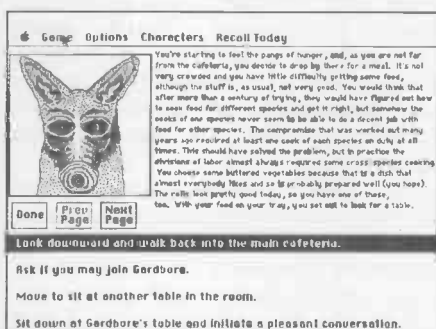

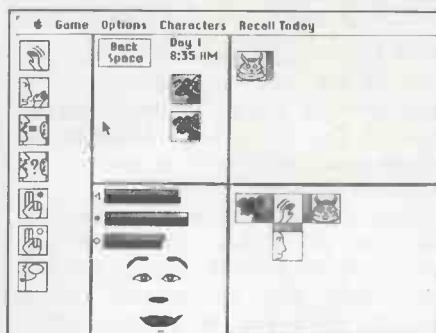

Back-stabbing is rife in religious circles, not just in politics, business and every sphere where ambition and jealousy are the driving forces. Thus, on Kira, our seven candidates must befriend and then betray each other, and ultimately battle among themselves to win knowledge of the various telepathic forms.

In play, *Trust & Betrayal* is unique. Like most Macintosh games it uses icons, but in a way that has, as far as I know, never been tried before. When play begins, the screen is divided into five sections comprising four rectangular windows, and a vertical strip which runs down the full length of the left-hand side of the screen. A menu bar, more of which later, is situated above the main playing area.

The above-mentioned strip is a menu which constantly changes to indicate, by way of small icons, the actions that are available at any given moment. Initially, there are just two icons in the menu. One shows a walking figure, and the other the rather incongruous symbol of a gun pointing at a watch: the former means 'go to' and the latter 'kill time', or wait.

Although there are a great many such icons in the game, several of which are very similar, you don't have to refer constantly to the manual to find out what each one does. You just click once on an icon and its image is replaced with a brief, written explanation of its function. Being a Macintosh game, *Trust & Betrayal* is entirely mouse-driven and is, therefore, extremely easy to learn.

The 'go to' icon enables you to walk to your own house or that of any one of the other six acolytes. If

you reach a house which is occupied, you may ask to be let in. Once inside, you can strike up a conversation with the creature whose house it is.

Dialogue with other characters is important, as it is the means by which you discover the telepathy levels of other acolytes. To be successful you must be diplomatic, or you will find characters reluctant to pass on information.

Communication with your fellow acolytes is simple, as, like everything else in the game, it is enabled through icons. The way you express yourself is extremely important. Some people like to be spoken to nicely, while others will yield information only after being threatened. It is important that you weigh up the character you wish to talk to and modify your speech accordingly.

The way you greet someone is crucial, as first impressions can have a profound effect on the way a character responds to your request for information. *Trust & Betrayal* contains seven icons simply for modifying a greeting. With these, you can greet a character warmly, nicely, sincerely, coolly, threateningly, haughtily or formally.

In general I find the warm greeting to be the best, as this can always be followed by a touch of flattery. This sounds terribly sycophantic, but nearly all the characters in the game respond positively to it because they are incredibly vain. There are times, though, when no amount of flattery will work. Sometimes you just have to swallow your pride and beg for information.

It is usually possible to see how well you are doing by the expression

on a face that appears near the bottom of the screen. Clicking on the face gives a short, detailed description of the character's feelings towards you; whether it is suspicious, flattered or angry.

During one of these conversations, you can ask if you have been betrayed by another character. Betrayal can mean one of several things, though generally it means either breaking a promise or divulging confidential information — that is, telling one character another character's aura count. A character believed to have been betrayed by anyone will normally retaliate by betraying its betrayer.

Information can be gained by requesting it or, more usually, by striking up a deal whereby you trade information. The latter is an act of betrayal on the part of both parties involved. The more deals you take part in, therefore, the worse your already shaky relations with the other acolytes becomes.

All the time you are wandering around between houses, wheeling and dealing, a clock, representing the time of day, is ticking away in the top left-hand corner of the screen. When night comes, you must select a character to fight for a prize of aura units. Clicking on the 'Characters' option in the menu bar along the top of the display gives a full run-down of the acolytes' individual aura counts. This gives you a chance to select the character who has the units you need.

To fight, you click on an adversary and then on the type of aura you intend to use as your 'weapon'. Which one you choose depends on the type of aura you want from the acolyte. Each aura has a different strength ratio and it is important that you choose the right one, as a defeat means losing whatever aura unit it was that you chose to fight with. It sounds complicated, but it is really nothing more than a computerised version of 'paper, scissors, stone'.

Trust & Betrayal also includes a number of random events. When one of these occurs, a screenful or more of descriptive prose appears, outlining a situation you suddenly find yourself in. Below the description are listed four possible responses from which you must select one. Although these events often appear to bear no relation to the rest of the game, the response you choose can affect your relationship with the other characters involved. So, when you see the private parts of a Fern, you should respond tactfully and not laugh.

Trust & Betrayal is wonderfully whimsical. It is one of those games that is very simple to play but so strategically complex that it is infuriatingly difficult to win. Or, at least it is when played on the hardest level. I'm not sure that I like Crawford's self-indulgent inclusion of a digitised picture of himself (Hitchcock he isn't), but Trust & Betrayal is a game that no Macintosh owner should be without.

## Broken English

**Title:** Metropolis  
**Computer:** IBM PC  
**Supplier:** Mastertronic  
**Format:** Disk  
**Price:** £19.99

If you remember Eliza, the program shell that was supposed to enable a computer to hold an intelligent discourse with a human being, you will know that intelligent was something it was not. A programmer has recently written an ambitious game, Metropolis, which uses an Eliza-type parser to allow you to talk directly to its characters in natural English. Unfortunately, though not altogether surprisingly, the computer I played Metropolis on had a very strange idea of what constitutes natural English, so its replies were not always what one would expect. Inanities are, it seems, still the major constituent of computer talk.

Metropolis is a detective yarn, set in a futuristic city that looks like the backdrop from a *Blade Runner* outtake. You are in Metropolis to track down the master tape of a new super-game, stolen from your company, IC&D, by a rival software house. The jokes and allusions are, as implied by the brief summary, all very 'in'; if you are not familiar with computer industry gossip or the pioneers of computing, you won't fully appreciate everything that goes on in the game.

Getting about Metropolis usually involves walking, though for long journeys you can use public transport and something called the

'ZoomTube'. First, though, you must convince a rather pedantic droid that you know inside out the rules for using the ZoomTube. Even though most of the world's evils have been eradicated in this futuristic fantasy, bureaucracy remains as rife and as pernicious as ever.

Clues, apparently, are thick on the ground, but I couldn't find any that were obvious. Not even the newsflashes that frequently appear on the right of the display helped much. These newsflashes are vital to the game because they tie events together and push the story along. As events happen in other parts of the city, they are picked up by the TV stations and broadcast immediately. There is supposed to be a sub-plot concerning a tiff between the various news channels of Metropolis, but I didn't get that far into the game.

Metropolis is simply an abundance of gimmicks, loosely linked by an incoherent storyline. As far as they go, though, the gimmicks are extremely well done. The animated graphics, for instance, are certainly some of the best I have seen on a PC. Your detective character, a podgy, raddle-

faced man in a natty jumpsuit, walks across the screen, nonchalantly swinging his arms. Various robots and droids do much the same thing; they, however, seem to be little more than extras who are there only so that you can stop them for a conversation. Some have useful information which they will gladly divulge — if you can find the phrases that will trigger the desired responses.

Another interesting feature of Metropolis is the speech; not the onscreen dialogue which appears in speech-bubbles, but the synthesised speech which pours through the computer's speaker when a character is talking. This is under total software control, and can be speeded up, slowed down or turned off, all from within the game via the keyboard.

Metropolis, for all its fancy features, is flawed through want of a good scenario. It is an ambitious project that has not quite succeeded. All credit to the game's programmer for having done everything, including the graphics, himself. In spite of his enthusiasm, though, it just doesn't grab your attention sufficiently to warrant a return visit.

With OS/2 breaking new ground in the operating system arena, this month our book reviewers assess current offerings ranging from DOS to Pick.

## Mastering DOS:

The complete tutorial and user's guide

Author: Judd Robbins  
 Publisher: Sybex Computer Books

ISBN: 0-89588-400-3  
 Price: £19.95

This large (500+ pages) book is both a tutorial introduction and a user's guide to the principal IBM PC/XT/AT operating systems PC-DOS and MS-DOS, covering versions 2.0 through 3.3.

As with most books of this genre, it starts from first principles with an introduction to hardware and software concepts and how to back up disks before moving on to elementary DOS operations. The next section is a tutorial-based guide aimed at introducing elementary file manipula-

tion and setting up suitable directory structures for running different application packages.

From the halfway stage in the book, the emphasis shifts from a tutorial approach to a more advanced text covering DOS usage for power users and system programmers. Unlike many DOS books, this section is not merely a catalogue of DOS features but clearly explains the use of such features through well-documented examples. Many of these examples are available on a disk obtainable from Sybex. (It's a pity Sybex didn't include one with the book.)

It is a measure of the quality of this book that the same clarity of description found in the introductory sections is maintained in the highly technical advanced section. This advanced section covers virtually

every aspect of DOS including keyboard customisation, sophisticated batch file usage and connecting multiple disk drives into a single DOS directory structure.

The last chapter looks at a range of utility software available for DOS machines and gives an even-handed assessment of their capabilities and limitations.

I very much liked *Mastering DOS*. It is clearly written, authoritative and, for once, succeeds in taking the reader from elementary DOS through to the design and application of sophisticated utilities. Either as a tutorial introduction or as a reference book for more advanced users, this book is one of the clearest and most authoritative guides to DOS that I've read.

Dr Simon Jones

## Hard Disk Management with MS-DOS and PC-DOS

Authors: Dan Gookin and Andy Townsend  
 Publisher: TAB Books Inc  
 ISBN: 0-8306-2897-5  
 Price: \$18.95 (US price)

This book delivers rather more than its title promises. It starts with a description of disk tech-

nology and becomes a general introduction to DOS; one of the best I've read, if more detailed than most business users would need (and more technical than they might like). By the time you've finished it you have a usable toolkit for large PC systems — batch programming, menus, DOS shells, back-up and recovery methods, and hints on improving performance.

The authors explain sub-directories well, using examples from a complex directory structure belonging to an imaginary company to teach the relevant MS-DOS commands. They're fond of DOS pipes to FIND and SORT to produce reports — some of the more long-winded examples ran rather slowly when I tried them out on a 30Mbyte disk with 63 subdirectories that I saw on a PC at work. When you have disks like that you need a book like this.

The second part, hard disk security, is necessary but boring. There's an overview of back-up methods, disk and tape, with software and hardware recommendations and a few example programs dealing

with passwords, encryption and logging. Things hot up again in the performance section: defragmentation, overlay files, RAM disks, caches are all surveyed. I'd be reluctant to take some of the hints — it's hard to imagine many people replacing the controllers of their hard disks — but I like a book that says: 'Modifying a directory ... is not at all recommended' then tells you how to do it with DEBUG.

The book has some bad points. It hasn't been properly proofread: for example, 'media' and 'phenomena' are treated as singular (irritating) and there is some confusion between '\ and '/' (nearly unforgivable: both slashes occur all too frequently in MS-DOS commands). However, it's friendly, readable, and useful, especially if you have to support other PC users. It's a book of 'hints and tips' really, almost a system programming guide. I know PCs are supposed to have liberated computers from these arcane mysteries, but things are getting more complex all the time. Just wait for OS/2!

Ken Brown

## Using Concurrent PC-DOS

Author: Mark Dahmke  
 Publisher: McGraw-Hill  
 ISBN: 0-07-015073-7  
 Price: £19.95

Concurrent PC-DOS is Digital Research's alternative to Microsoft's Windows and provides the multi-tasking facilities that MS-DOS lacks. The reader that this book is aimed at, therefore, will be emigrating from MS-DOS and would probably

want an overview of the new system plus some discussion of the special features provided. I am not sure, however, if Dahmke's book exactly fits the bill. It is insubstantial (150 pages) and greatly overpriced, offering a very quick canter through the subject (I read the whole book in one evening) and glossing over any area which threatens to require a fuller treatment.

Yet it is useful. The introductory chapters provide a concise overview of the history of PC operating systems in general and Concurrent PC-DOS in particular. The concept of concurrency itself is also explained quite clearly, and Dahmke provides numerous illustrations of the various screen displays to clarify the textual explanations of individual Concurrent PC-DOS functions. There is also an appendix of Concurrent PC-DOS commands in quick-guide format which would be useful

once one was fairly familiar with the system.

Nevertheless, the book is disappointing. The chapter which I found particularly frustrating was the one entitled 'Customizing Your Personal Computer'. This is just nine pages long whereas it really should have been as long as all the other chapters put together. There are no examples of batch files which would exploit the Concurrent PC-DOS multiple window environment, merely a few airy references, in the book's usual throwaway style, to possibilities which are not explored. Certainly, Dahmke does not attempt to convey the idea that working within a multi-tasking environment might involve different disciplines from single-tasking.

All in all, this is a book to skim through in a quiet hour in a book shop before buying something else!

Jeff Wells

## The CP/M Plus Handbook

Author: Alan R Miller  
 Publisher: Sybex Computer Books  
 ISBN: 0-89588-158-6  
 Price: £13.95

The objective of this book is to teach the use of the CP/M Plus operating system: no previous knowledge of computing by the reader is assumed.

The *CP/M Plus Handbook* opens with a section that describes what a computer is and how to turn it on and off safely (take the disks out first). Following this, the book is organised into four main sections. The first covers backing-up disks and elementary file manipulation using the PIP utility. The second section covers the most commonly used commands such as listing a file directory and renaming and deleting files. Following this is a section devoted to more complex PIP operations such as concatenating files, copying system files and resetting parity bits. The fourth section covers basic text manipulation using the CP/M editor and, rather out of place I feel, the internal structure of CP/M. The book ends with a summary of CP/M commands.

Alan Miller's writing style is reasonably clear and if you read this book you will end up with a solid appreciation of the structure and commands of CP/M. As such Amstrad PCW owners might think that this book is relevant to them; I do not feel this to be so. This is not a new book; it was originally published in the US in 1984. This is confirmed by the very old-fashioned pictures used. The Osborne Executive machine (now, long-defunct) is pictured as 'a typical CP/M machine'. Furthermore, only 8in and 5½in disks are discus-

sed. No mention of more modern disk formats is made.

The *CP/M Plus Handbook* is an adequate introduction to CP/M, but frankly I can't see at whom the book is aimed. Amstrad users don't need to use the system editor or PIP for most tasks, as the majority of these functions can be performed by Locoscript. The number of newcomers to old-style CP/M machines must be very small and the book is not detailed enough to appeal to those CP/M users looking for an advanced guide.

Dr Simon Jones

## A Concise Introduction to MS-DOS

Author: Noel Kantaris  
 Publisher: Bernard Babani (Publishing) Ltd  
 ISBN: 0-85934-177-1  
 Price: £2.95

To any user who has waded their way through the massive MS-DOS/PC-DOS operating manual and then cried 'I wish there were a few more examples', or 'What does that mean in English?', then rest assured; your pleas have been heard. *A Concise Introduction to MS-DOS* has been written with you in mind.

This book in no way claims to replace the MS-DOS/PC-DOS manual; indeed, at only 39 pages its typeface would have to be microscopic to attempt that feat, but only 'to supplement and explain it' and it follows the doctrine of 'what you need to know first, appears first'.

With an ME in Electronics and a PhD in Physics to his credit, the author, currently Head of Computing at the Camborne School of Mines, keeps his text compact and relevant. He assumes that the reader has some familiarity with floppy disks and hard disk drives and has read the micro-computer's installation manu-

## The Pick Operating System: A Practical Guide

Author: Roger J Bourdon  
 Publisher: Addison-Wesley  
 ISBN: 0-201-18055-3  
 Price: £15.95

Pick, named after its inventor, the euphonious Dick Pick, is often touted as a rival to Unix in the war for an industry standard multi-tasking operating system. However, while Unix developed in the scientific and academic markets, Pick has always been aimed squarely at the business user.

With commercial needs in mind, Pick was designed around a database manager and its query language. All files are in a common database format regardless of whether they are data or

programs and can, therefore, all be processed by the query language. This integration of a database into the operating system has won Pick many devoted adherents.

In this book Roger Bourdon sets out to appeal to the whole spectrum of potential users, from complete beginners right through to system managers. Thus he starts at the very beginning with booting the system and logging on. This is followed by an account of the database structure, a tutorial on Pick's amazingly primitive line editor and a chapter on the use of printers. He then launches into the meat of the book with chapters on the query language, programming in Pick Basic and the system command language, PROC. The remainder is taken up with a brief summary of the text formatter, RUNOFF, a couple of chapters of advice to system managers, Pick on the IBM PC and a comparison with other operating systems.

Each topic is covered in considerable depth, explaining relevant commands with all their optional parameters. Unfortunately all the detail is thrust upon us at once: there is no progression from simple to complex and I was left floundering, unable to tell the useful from the esoteric.

I cannot recommend the book, therefore, to beginners since it does not provide an easy way into Pick. However, it does contain a lot of information and more experienced users might find it useful as a reference manual.

Nicolas North

al. Commands are explained simply with examples given, although there were times when I felt he could have been more aggressive — for example, on the FORMAT command: 'be careful never to format an already formatted disc' — sometimes instructions have to be written in blood! Time and care is spent illustrating the EDLIN Line Editor and the creation of directories, sub-directories and batch files are all clearly discussed.

At £2.95 you'll be hard pushed to find better value.

Lorna Kyle

## GENERAL

### Introduction to Programming

The Computer Studies Series

#### Introduction to Programming

Jeff Naylor

**Author:** Jeff Naylor  
**Publisher:** Paradigm  
**ISBN:** 0-948825-45-6  
**Price:** £8.95

A book written for students by those responsible for designing their courses and syllabuses is a gift indeed. Therefore, those reading computer studies as any part of their curriculum should rush to their bookshop and purchase *Introduction to Programming* by Jeff Naylor. The author is the principal lecturer in computer science at the South Bank Polytechnic and a member of BTEC's Computer Studies and Information Technology validation panels. His writing is succinct and knowledgeable as well you might expect and he concludes each chapter with a summary and exercises (unfortunately, no answers are supplied) as one would in a lecture; indeed, he confesses that the contents of his book are largely derived from his lectures.

No previous knowledge of computing or programming is assumed and Chapter 1 serves as an introduction to the programming environment of

operating systems, language translators and text editors. The course of the subsequent chapters is fairly fast flowing, moving through control structures, debugging and testing, structured design and ending with the future of programming and the discussion of the possibility of a universal programming language.

This pace is as you might expect in a degree or HNC course, but the text is clearly explained and obviously a book always offers the opportunity of re-reading and re-digesting, something a lecture doesn't.

This volume is designed to stand alone as an introduction to programming but it also forms part of Paradigm's Computer Studies series' integrated approach to all aspects of computing required by most students of further education.

You don't have to be a student of course to reap its benefits, but I'd rate this book as a worthwhile addition to any user's computing library.

Lorna Kyle

### Hacker's Handbook III

**Author:** Hugo Cornwall  
**Publisher:** Century Hutchinson  
**ISBN:** 0-7126-11479  
**Price:** £6.95

This latest incarnation of *The Hacker's Handbook* looks, in places, like the computer enthusiast's version of *Spy-c\*\*cher*. There is a very impressive chapter (around 40% of the book has not appeared in previous versions) about how two UK journalists discovered details of the computer installation used by MI5. The actual details include the make and model of the machine, the number of terminals, the operating system and the communications protocol. How-

ever, the (fairly simple) method which allowed the journalists to gather this information is probably more useful to amateur sleuths than the eventual results.

The chapter on Government installations is just one of the additions in *HH3*. Another is the updated information on previously-reported hacks, including the Prince Philip Prestel hack. The report on this one in particular now includes details of the acquittal in the High Court. Thankfully, the chapter on radio hacking has been trimmed, as I always felt that such information was slightly out of place. While many computer users have modems, few have RTTY (radio teletype) receivers.

As before, the book contains full details of the events leading up to a number of 'unauthorised accesses' to computer systems. Some people are bound to criticise the author for explaining the tricks. However, my personal feeling is that the only way to protect computer information is by employing experienced security managers. Knowing how to spot the early stages of a hack — and how to prevent them happening altogether — requires some knowledge of the way a hacker thinks and operates, and this is what the book is trying to provide. As such, I feel it should be required reading for anyone involved in upholding the security of a computer, as well as anyone who has a spare phone line and is fed up with paying 38p per minute for a one-way conversation with Sexy Samantha.

And if you're not already into computer communications, prepare to be amazed.

Roger Dalton

### The Complete HyperCard Handbook

**Author:** Danny Goodman  
**Publisher:** Bantam Books  
**ISBN:** 0-533-34391-2  
**Price:** \$29.95

I am always very suspicious of computer books that are published a matter of weeks after their subject is launched. It usually means one of two things: either the book is no more than a rewrite of the manual, or the author has been commissioned by the manufacturer to write an accompanying book. In the first case, the book is rarely worth the paper it is printed on; in the second, it is often a dull and biased read. *The Complete HyperCard Handbook* is a hefty 700-page tome that arrived at practically the same time as HyperCard itself. I was prepared for the worst.

By page 5 it was obvious that this book is different. Author Danny Goodman has been involved with HyperCard for the past year and a half, since the time it was little more than a few MacPaint pictures. By page 10 I'd fired up my Macintosh and was busy following a guided tour of HyperCard concepts. *The Complete HyperCard Handbook* is not a reference book; it is a book to be worked through page by page with a Macintosh in front of you all the way.

The book is basically divided into four sections: Browsing through HyperCard, HyperCard's Authoring Environment, HyperCard's Programming Environment and Applying HyperCard & HyperTalk.

The section on HyperCard's programming environment is where the book really excels, for me totally replacing the official Apple documentation. I particularly recommend this section for those with no previous programming experience, as the author purposefully steers clear of making analogies with existing programming languages. One chapter which lists the properties of every element in HyperCard is now incredibly dog-eared after less than one month's use.

HyperCard is a wonderful piece of software. *The Complete HyperCard Handbook* is a wonderful book.

# JPI MODULA-2 OUTPERFORMS ALL OTHER COMPILERS

JPI Modula-2 produces better code than Microsoft-C, Turbo-C, Logitech Modula, Turbo Pascal or any other compiler you might care to choose.

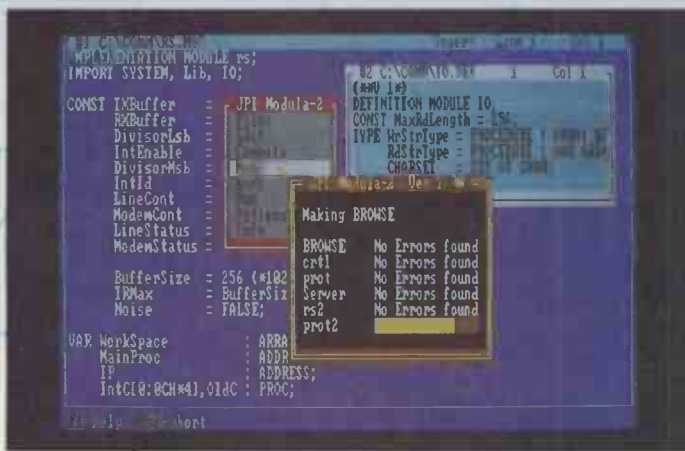

Here are the facts:

Sieve Benchmark*	Code size	Execution Time
Turbo Pascal V4.0	165	9.6
<b>JPI Modula-2 V1.0</b>	<b>95</b>	<b>3.3</b>
Turbo-C V1.0	115	4.4
Microsoft CV4.0	130	7.4
Logitech V3.0	165	7.4

\*Modula-2 was developed by Niklaus Wirth, the father of Pascal, as a powerful successor to Pascal.

## Compiler Highlights

Full version 3.0 implementation as defined by Wirth. Compiles 3-5000 lines/minute (PC AT 8MHz). Up to 1MB code and data. Long and short pointers. Short pointers supported in all segments. Total segment control (memory models). Generates standard OBJ files. Separate compilation of modules. Automatic "librarian". Built-in automatic "make" facility. Supports multi-tasking. 8087 support. Complete MS-DOS support.

For only £79.95 inc. VAT you get all of the above including full source code to the libraries and the window manager. Shipped free of charge in the U.K.

Runs on all IBM PCs and compatibles, including the Amstrad 1512 and 1640.

No-questions-asked 30 day money back guarantee.

## ORDER NOW

Dial 0800-444143 free of charge 24 Hours. COD and credit cards accepted. We ship within 24 hours

For further information or to order by mail contact: Jensen & Partners U.K. Ltd., 63 Clerkenwell Rd., London EC1M 5NP. Phone: (01) 253 4333.

\*25 iterations on Compaq 286 at 8MHz.

Brand and product names are trade marks or registered trademarks of their respective holders.

## Environment Highlights

Multiple window editor with re-configurable commands. Edit several files simultaneously. Compile, link and run programs with a single keystroke. Pin-points compile-time and run-time errors in the source instantaneously. Context sensitive built-in help system. Built-in data-communications package which will connect you to JPI's TechLine. All environment commands and menus are re-configurable. Windows may be resized, re-coloured and moved around at any time.

## Technical support 24 hours a day

Technical support is available 24 hours a day via J&P's exclusive TechLine which allows you to connect via modem directly to our computer. Technical support is of course also available during normal business hours via telephone or mail.

## Complete documentation

The system comes with a 250 page typeset manual which provides an introduction to Modula-2 and a detailed description of the JPI Modula-2 system.

```

# Musical touch

Finding a Basic way of writing tunes, a library of songs, a composing brainstorm and a harmonious sampler. Roger Howorth puts more music at your fingertips.

Last month I detailed the software instructions available to the MIDI programmer, which are part of the internationally agreed specification for the MIDI interface. As a follow-on, this month I have included a short Basic program that will display data as it arrives at the MIDI port, as well as allow simple instructions to be sent from your computer.

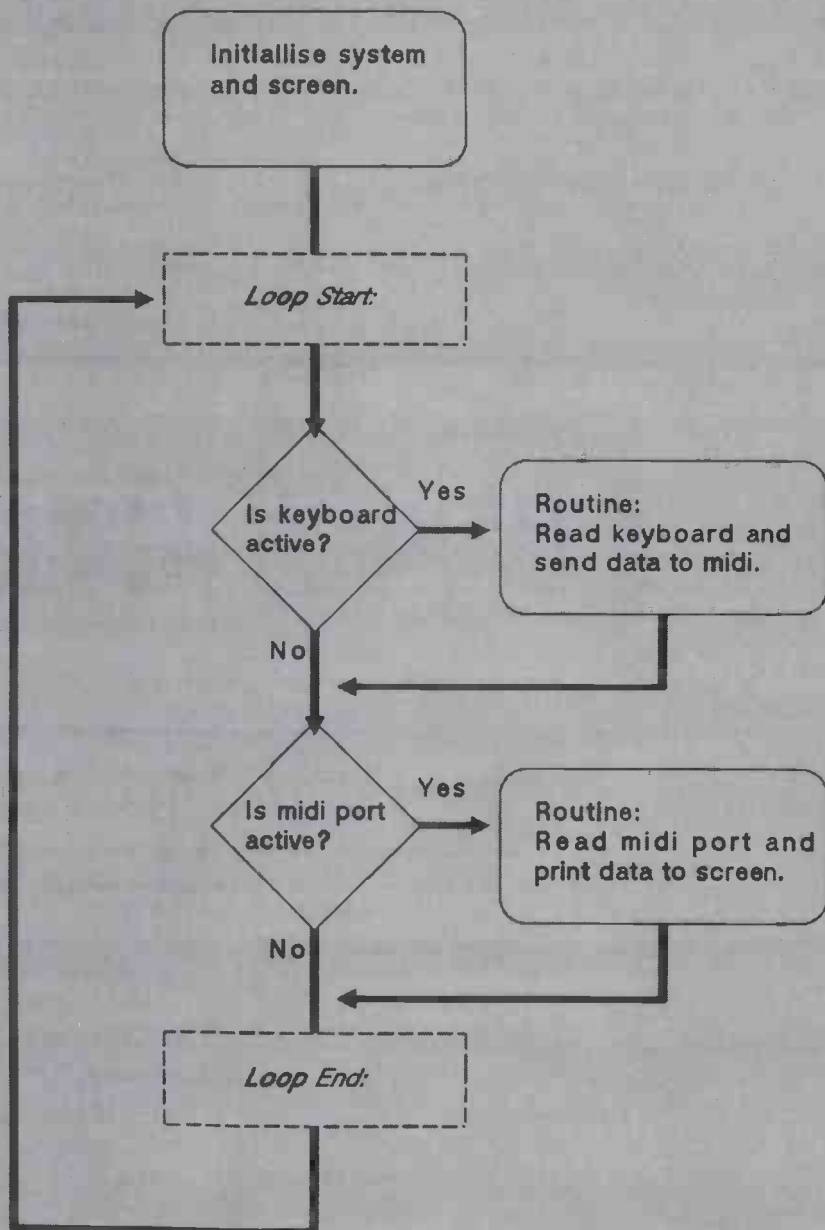

The program was written in Basic on an Atari ST, which is the only computer that comes with a true MIDI interface as standard, but it could easily be adapted to run on any computer fitted with an add-on interface. The simple flow chart presented here might prove useful in converting this program to other languages or computers.

The core of the program is a loop that continually checks whether data is present at the computer's keyboard and MIDI interface: as soon as data appears, the loop branches to a subroutine to read that data and either send it out to the MIDI port or print it onscreen as appropriate.

Unfortunately, Atari Basic is rather slow at checking for data at the keyboard, which makes the program tedious to use in its present state. I have deliberately not improved this section of code because to do so would involve using instructions that are not only highly machine-dependent, but also incredibly cryptic.

By virtue of MIDI's ability to operate with so few instructions, it is relatively easy to produce useful programs quite quickly. The program featured here, while crude and slow, does provide a starting block for other, more advanced ones. Indeed, for those with no

MIDI terminal flowchart

# MUSICAL INTERLUDE

The new Music City section on Prestel provides news, features, and downloadable files of pop tunes. There are charges for some files, with the most popular costing 50p

musical hardware, it is possible to alter the program so that rather than communicating with a synthesiser, two or more computers could be linked together to form a simple 'network'.

## Musical modem

As if recent price rises at Telecom Gold were not enough, another reason for subscribing to Prestel has emerged. Micronet has announced a new

service called Music City, which it describes as an 'online' music magazine.

One of its proudest features is that subscribers can download files of music software for use with their favourite sequencer. Initially, Micronet plans to support only a few hardware-software combinations centred around the Commodore 64 and the Hybrid Music System for the BBC Micro, but hopefully this range

should expand quickly to other computers and software.

The strength of such a service in tandem with a few of the specialist bulletin boards, notably Pan in the US, is that anyone with a modem can gain access to potentially vast quantities of pre-programmed music files which can be downloaded and played. Their weakness is usually that they suffer through the understandable reluctance of songwriters to part with their copyright compositions. This leaves little else but implementations of classical and other 'public domain' music such as folk and traditional songs.

In an attempt to combat this problem, or perhaps simply to ensure that it doesn't fall foul of copyright law, Micronet has made an arrangement with the Mechanical Copyright Protection Society whereby royalty payments will be made whenever appropriate. Exactly what this will mean to the home musician remains to be seen, but it is certainly a step in the right direction.

It costs £66 per year to join Micronet, which includes the necessary subscription to Prestel. Micronet is also offering a free modem to all new annual subscribers.

## Bats in the belfry . . .

Not to be outdone by Micronet, Westhill Music is also proud to announce an 'intelligent music breakthrough', MasterComposer. Westhill, via its latest press release, assures me that its new baby is not just a passive music sequencer but a composer in the truest sense.

The program was written by a professional mathematician, research scientist and musician who was 'determined to disprove the cynical comments of his colleagues'. He spent seven years developing his algorithms before finally 'the analysis of music produced this new development in machine intelligence'.

This, says the company, has resulted in a program that uses expert knowledge of harmony and rhythm to compose individual melodies that are never the same!

Fear not, 'the complexity is all inside the program', the good doctor of mathematics goes on to explain. But, what's this? Westhill may never be able to sell us his best program! 'It would be like selling a piece of my brain,' he declares.

More amazing than any of Westhill's claims for this exciting product are that it can all be done on a standard Amstrad CPC. Cast off your

4Mbyte/386 processor/VGA system and splash out £29 on your Amstrad.

## Instant Music on cassette

Finally, the news from Electronic Arts is that Instant Music is now available for the Commodore 64 on both disk and cassette.

Instant Music is another 'intelligent' program that has been available on the Amiga for some time, and this new implementation has a lot in common with its more advanced cousin.

Although basically a sequencer, Instant Music is unusual in that, as opposed to traditional sequencers which are like a blank piece of paper waiting to be filled with your musical ideas, Instant Music is more like a radio. It comes with a variety of sounds and a few pre-programmed tunes that can be altered and fiddled around with very easily — some enthusiasts would say instantly.

To make life as simple as possible, you tell the computer what notes or chords to play in real time by moving a cursor up and down the screen with a joystick or a mouse. The program then interprets your movements and plays the appropriate notes so that the final result is harmonically pleasing rather than being a jumbled and discordant mess, which it would be if these rather clumsy input devices were left uncorrected.

The main difference between the two versions is that whereas the Amiga allows you to work with four sounds simultaneously, the Commodore 64 version works with only three at a time. These are synthesised with the C64's sound chip rather than being samples of real sounds as on the Amiga. The C64 version scores over the Amiga by including a crude sound editor that allows you to customise any of the sounds that are supplied with the program.

Instant Music costs £14.95 on the Commodore 64 and £24.95 for the Amiga version.

Micronet is on (01) 278 3143.  
Westhill Music is on (0224) 740412.  
Electronic Arts is on (01) 736 4281.

Roger Howorth is a freelance computer journalist and sound recording engineer who owns and experiments musically with an Atari ST. If you would like to share your musical experience with him or you would like to pass on any interesting snippets, write to him care of PCW, VNU House, 32-34 Broadwick Street, London W1A 2HG. **END**

Next Day Delivery £5.00 Extra

## AMSTRAD 1512/1640

Great range - Great prices

We can offer a vast choice of Amstrad PCs, choose the model to suit your needs. Our Evesham upgraded models offer fantastic value for hard disk buyers. Upgrade is normally by means of a Western Digital Filecard (yes you do get Xtree), however on single drive models we can offer internal installations at the same price (leaves more expansion room but no room for 2nd floppy). Other options are, 640K memory on 1512 - £20.00, 3.5" 2nd drive on any SD models - £115.00. Prices in light type are excluding VAT.

## COPY II OPTION BOARD

The ultimate solution to backing up copy protected software.

The hardware answer to those difficult protection schemes

For just £79.95 you get:

- The most POWERFUL backup product
- Copies even the most highly PROTECTED software
- Copies many NON-IBM formats
- Easy to fit SHORT CARD occupies one expansion slot
- SIMPLE to use
- AMSTRAD instructions provided

The results you want, guaranteed!

Only £79.95

All prices VAT/delivery inclusive. Next day delivery £5.00 extra.

### How to order...

Send cheque P.O. or ACCESS/VISA details

## PC TOOLS DELUXE

The most powerful utilities package ever put on a disk.

Other utilities may claim that they 'do it all' but only PC Tools Deluxe delivers all the best features of Fastback, Norton, XTREE, Mace, Sidekick, Lightning and Disk Optimizer.

For just £69.95, you get:

- The best UNDELETE available, recovers all data, even on fragmented files.
- PCBACKUP a hard disk backup faster and every bit as reliable as Fastback.
- The leading UNFORMAT for hard disks and floppy disks, enabling you to recover from almost any disk disaster.
- PCFORMAT for 100% safe formatting of floppy and hard disks.
- Fast, reliable DISK CACHING for speeding up disk access.
- A speedy COMPRESS feature that like Disk Optimizer dramatically improves hard disk performance.
- A better resident mini WORD PROCESSOR than Sidekick, including word wrap, search/replace, formatted page printing and more.
- A complete DOS shell that lets you access DOS even inside other programs and includes graphic directory display.

"...There's no reason to look beyond PC Tools..."

## COPY II PC

Protect your software investment.

The most effective product of it's type. We always ship the very latest version.

For just £34.95, you get:

- The most POWERFUL backup program on the market.
- Includes the NOKEY & NOGUARD utilities.
- TRANSFER many popular business programs, eg. 1-2-3, Symphony, dBase etc., to hard disk and run them without reference to floppy (using the NOKEY utility).

"...Copy II PC is one of the programs I cannot live without..."

Microtimes

- VERIFIES all copies automatically.
- INCLUDES disk drive speed check.
- DEPROTECT many popular programs (using the NOGUARD utility).
- ELIMINATE the need to uninstall when doing a backup/restore of popular programs like Lotus 1-2-3 & Symphony.
- SUPPORTS 3.5 inch disk format.

Gold Medal winner, over 100,000 sold!

Can you afford to be without it?

Only £34.95

## PRINTERS

Prices include... CABLE, VAT & DELIVERY

Make the right decision, with a

star PRINTER

NEW! NEW! NEW!

Star LC-10 Replaces NL-10, similar features PLUS 4 NLQ fonts, paper parking, IBM/parallel etc.

# Modems and more

Comms links come in many guises. How do you choose the right one? Peter Tootill answers some oft-asked questions, considers downloading to a word processor and gives viewdata a look.

I recently received a letter from David Garrat of Wisbech. In it he asks me to clarify some basic issues that he finds confusing, and they are the sort of things that confuse many people when they first come into contact with microcomputer communications.

The main questions concern modems, so I will deal with those first. Can a full duplex modem talk to a half duplex modem or do they have to match? The answer is generally no; a full duplex modem can't talk to a half duplex modem — the modems at opposite ends of the line must match.

**Full duplex** means that data can travel in both directions at the same time, like a telephone conversation. **Half duplex** means that data can travel one way at a time only, like walkie-talkie or CB radios. One end has to say 'over' before the other can reply.

However, confusion can arise because people use the same terminology for two entirely different things — modems and terminal software. Here we are talking about *modems* not about how the modems are used. Just as it is possible to have a half duplex telephone conversation on a normal phone line (each person waiting for the other to finish) it is possible to have a half duplex link between two micros using full duplex modems. Full duplex transmission works by using two different frequencies, one to transmit and the other to receive. This is a useful thing to do as it helps confirm that everything is working satisfactorily. Let me explain why.

In most cases when you call an online service such as Prestel or a bulletin board, it uses

the full duplex mode to allow it to echo everything you send back to you so that you can see what you have typed. This means that when you type, for example, a page number on Prestel and it appears on your screen, it is actually being put there by Prestel, not directly by your computer at all. It is confirmation that the number has been received correctly and hasn't been corrupted by line

**'a full duplex  
modem can't talk  
to a half duplex  
modem ...'**

noise on the way. With half duplex modems, only one frequency is used for transmission in both directions, so that information can go only in one direction at a time. This means, among other things, that the remote system can't echo data back as you type it, so half duplex modems are rarely used for normal online systems.

However, if you call a friend and link your computer to theirs (to send them a copy of the program you have just written, for example) you will probably find that when you type something it appears on your friend's screen but not on yours and vice versa. This is because you both have your software set to the mode for using normal online systems (as we saw above, they echo data back to you) and if both

ends are expecting data to be echoed back, neither will actually do it. To 'talk' to your friend, you will both have to change your settings to provide local echo — this is often (misleadingly in my view) called 'half duplex' because it is the mode used with half duplex modems. The whole thing can be difficult to grasp, so perhaps it will help if I summarise the terms used:

**Remote echo** This is the normal method of working with online systems such as Prestel, Telecom Gold, bulletin boards, and so on. The remote online system echoes data back to the caller as it is typed. Sometimes called 'feed back'. Cannot be used with half duplex modems.

**Local echo** This is the setting you would use if you were calling another person rather than a BBS or similar. Characters are echoed to the screen by the terminal software as you type them in, at the same time as they are sent to the remote system. Sometimes called half duplex mode (see above).

(NB: The V.23 standard (see below) is sometimes called half duplex, but that is not strictly accurate. Data can travel in both directions at the same time, but it does so at different speeds: 1200 bits/sec one way and 75 bits/sec the other. It is sometimes called asymmetric duplex.)

The second question concerns modems with auto-dial facilities. Do you require special software to drive them? The answer is not always, but it does help.

Most auto-dial modems available these days use the Hayes command language. The modem is given instructions simply by preceding

them with the letters 'AT' for 'attention'. For example, you tell the modem to dial the number (01)618 1111 by typing 'ATD(01)618 1111'. This means that most terminal software can be used to drive them.

However, many communications packages available these days have special features built in to support Hayes-type modems. So you can set up a dialling directory with a list of your most frequently used numbers and simply tell the software that you want, for example, number 12 on the list. It will then go away and dial the number associated with that entry and, in many cases, automatically takes you right through the log-on process.

As well as the Hayes system, there is also an international standard for auto-dialling with modems (called V.25bis) but very few manufacturers of modems or software support it. Again you can use it by typing in commands but they are more complex and include control codes — best avoided, in my view.

Modems in both the above categories incorporate a micro-processor of some description (often a Z80 or 6502 — remember them?) and are called 'intelligent' modems, because they understand simple commands. Another type of auto-dial modem has no micro-processor and is (obviously) called a dumb modem. These definitely need special software, but are now rare and usually not BAPT-approved, at least not with the auto-dial option fitted.

David Garrat also raised the following points. 'I recently bought a (very cheap) 2400 baud *synchronous* modem. I now suspect that it will be of very little use to me as most

online systems using 2400 baud are *asynchronous*.

It is quite right to say that online dial-up systems generally use asynchronous modems. Furthermore, there are several different sorts of 2400 bits/sec modems available. Many of them are not designed to be used on ordinary telephone lines at all but on private direct connections or leased lines (permanent links hired from BT). These modems are frequently used in commercial environments (to link terminals in remote offices to a company's mainframe, for example). So be careful if you are buying a second-hand modem — if you want one for general use, the standards to look for are:

**V.21** (300 bits/sec) This is supported by most online systems (but not by all viewdata systems). A little slow by modern standards, but very cheap to buy.

**V.23** (1200 bits/sec from the online system to you and 75 bits/sec from you back to it). This is the normal standard for viewdata systems and is also supported by most other online systems. In most cases it is better than V.21 as information comes to you four times as quickly but it is not so good if you want to *send* a lot of data as that can travel at one quarter of the speed. Also cheap to buy.

**V.22** (1200 bits/sec full duplex) supported by most commercial online systems and a growing number of BBS. Better than V.23 because you can *send* information four times as quickly as with V.21 (and 16 times as quickly as with V.23). Has until recently been a bit expensive for domestic use but prices are falling and the modems are now becoming available in the £200-£300 range.

**V.22bis** (2400 bits/sec full duplex). Faster still and more expensive (starting at about £500) but prices are falling.

Most of the faster modems incorporate one or more of the slower standards as well. Other V standards exist, but are not used by the dial-up systems the majority of us will be calling either for business or personal use.

On the subject of V.22bis modems — someone left a note on my BBS recently saying that he and some friends had calculated that full duplex operation at 2400 baud is impossible on an ordinary telephone line. They are quite right. Next month I'll tell you why — and explain how V.22 bis is really only 600-baud full duplex, although data is transferred at 2400 bits per second

An example of PC-Write's many Help screens

in both directions! The key lies in the difference between bits per second and baud.)

## PSS

Another of David's questions concerned PSS (BT's packet switching data network). He asks 'If there are no bulletin boards in my local area, should I subscribe to PSS?'

The answer is probably not. PSS is not a system that you use like a BBS. It is like the telephone network, except that it is for data. You use PSS to contact services that are linked to it, in the same way that you use the telephone system to call other telephone subscribers.

PSS is, however, a little different in that there are two types of PSS subscribers. The first are the providers of online services, such as Telecom Gold, who are permanently wired to the PSS network by (expensive) data links. The others, the users, connect to PSS and thence to the remote system by dialling their local access point in the same way as they would contact Prestel or a BBS. They then tell PSS which online service they want by giving its network user address (NUA) which is equivalent to the telephone number on the telephone system.

There is, therefore, no point in joining PSS unless you want to use one of the services linked to it (after all, you wouldn't have a telephone unless there were people you wanted to call). Most of them are expensive commercial systems.

Furthermore, many commercial systems have special arrangements with PSS so you don't actually need to join. Instead, you use the company's PSS account and pay a small extra fee for the privilege. At present there are no BBS type

systems available on PSS — the nearest you'll get to that is Microlink, and you don't need to have your own PSS account to use it because you use theirs. The cost is added to your bill (that's why there's an extra 2p minimum charge if you use the PSS access points).

The bottom line is: don't bother with PSS unless a system you want to join tells you that you'll need a PSS account.

## PC-Write

This is not the place you'd expect to find a review of a word processing package, and I'm not about to give you one. However, one of the problems of downloading information from BBS is that text files come in a range of formats. Some have linefeeds with no carriage returns or vice versa, which can confuse word processing packages and printers since they often expect both. Also, if you are not using error-correcting protocols, you tend to get line noise affecting the text as well.

One of the advantages I have found with PC-Write is that the search and replace features are very powerful. It is easy to search for just about any character, including carriage returns or line feeds with the necessary carriage return/line feed pairing. In fact there is a built-in feature for repairing line breaks that adds carriage return to line feed, but I find that I usually end up with the opposite problem. There is also a command to search for the next non-ASCII (that is, not normal text) character — useful for finding line noise. PC-Write even allows you to edit the text portions of EXE and COM files and to load and save disk sectors!

I like PC-Write, it is lightning-fast and very powerful, but I

must admit that it is a bit complex and idiosyncratic to use. It is also limited to files of 60k or less (but provides a facility to split up the longer ones. As an aside, the mailmerge features are very powerful as well.

PC-Write version 2.4 is available as shareware from many BBSs and software libraries. Version 2.7 (which has quite a good spelling checker) is published by Sage at about £95 and is available from most retailers. Sage is on (091) 284 7077.

## Epnitex

First covered in PCW in March last year, Epnitex (a viewdata system designed to compete with Prestel) has finally been launched. Said chairman Roy Norman: 'We were reluctant to launch Epnitex earlier when it was structured and ready. Instead we took the decision to wait until there were sufficient user refinements added to leave the competition behind.'

Well, that sounds a bit like stalling to me; it seems more likely that all the bugs hadn't been ironed out. When I looked at the system I was impressed. They had obviously learned from Prestel's shortcomings and come up with some good ideas for the business community (such as a rotating carousel of frames that can be continuously displayed in public places and instantly updated from a central point). The messaging features are much slicker than Prestel's and include word wrap, automatic reply, radio paging and full editing features.

The subscription costs are high compared with those for Prestel and I don't think they will have much impact on the domestic market. Business subscriptions are £300 pa; other subscribers (who can call outside peak times only) pay £2.40 per week. Time charges are 5p/minute, but the first five minutes (business) and 15 minutes (others) per day are free. On top of this there are ordinary BT charges to pay as there is no local call access and you have to dial the Lincoln code. However, there are no page charges and that will certainly make a difference for business users because some of the Prestel pages they use carry quite high charges. Epnitex claims it had 50 information providers signed up within one month of the public launch.

For more details, phone (0526) 861136.

Peter Tootill can be contacted on Telecom Gold 83:VNU202, Prestel 219991119 or CompuServe 72746, 3202. **END**

# PC TO PS/2 COMPATIBILITY

(IN 360Kb and 1.2Mb FORMATS)

If you are looking for a fast and convenient way to transfer those valuable files from your IBM PC/XT/AT or compatible to the new IBM PERSONAL SYSTEM/2 then the PLUS-FD 500 Series is the answer.

FD-500 is an external 5¼" floppy disc drive for the IBM PS/2, available as either a dedicated 360Kb unit or software detected 360Kb / 1.2Mb unit.

FD-500 is supplied in an attractive compact case and is easy to install via a single flat ribbon cable connected to the PS/2.

FD55H	PS/2.50	Dual Format	
	Upwards	1.2Mb/360Kb	£350

## PLUS-FD 'OPTIONS'

The PLUS-FD range offers many options for floppy disc transfer between micro's of different formats and/or drive sizes including:

- FD3I 3½" internal / external floppy drive (720K) for IBM PC/XT/AT or compatible to read, write and format a variety of 3½" formats, including IBM PS/2, APRICOT AND TOSHIBA.
- FD5A 5¼" external floppy drive (360K) for APRICOT PC/Xi to read, write and format IBM 180K and 360K formats.
- For the SIRIUS/VICTOR 9000 we offer both 5¼" IBM format floppy drives and 3½" IBM/Apricot format drives. A dual 5¼" plus 3½" unit is also available.

# A mixed bag

**A reminder about the details of the PCW Disk Library Catalogue, a sensible solution to a scheduling problem, and this month's readers' programs, presented by Owen Linderholm.**

The PCW Disk Library Catalogue has not been updated this month because of the extended Christmas holiday. However, there will be a bumper crop next month!

The disks cost £5 each, which includes VAT, postage and packing. Of this £5, a royalty of 50p will go to the authors (split evenly between them if there are more than one).

The disks are *not* public domain and may not be copied at will. If you order one and friends want copies, they will have to purchase their own.

Programs will not be immediately available after being published in *PCW*. There is an inevitable delay in organisation and, since we want to provide two programs per disk, we may have to wait until two suitable programs are available. However, if a

program *is* to appear in the disk library at some point, the PCW Disk Library logo will appear by its title in Program File. As soon as a program is available, it will appear in the catalogue which appears opposite.

No documentation is provided with the disks except that which is embedded in the program. So, only order disks for which you have the relevant issues of *PCW*, unless the lack of documentation is not a problem. Some back issues are available and can be ordered from the Back Issues department at VNU House, 32-34 Broadwick Street, London W1A 2HG, or by telephone on (01) 439 4242 (ask for Back Issues).

The catalogue list is organised by machine. The first number is the disk's catalogue number which

should be quoted when ordering. The date is the issue of the magazine in which the program appeared, and the rest is a brief description.

Disks can *only* be ordered from S&S Enterprises, PCW Disk Library, 31 Holloway Lane, Amersham, Bucks HP6 6DJ. Payment can be made by credit card, cheque, banker's draft, postal order or cash. Telephone orders can be made by credit card to (02403) 4201 or (02403) 28095. Please do *not* contact the *PCW* office about orders — we *cannot* help.

## Christmas cheer

I would like to thank Jaroslav Mlodzski for cheering me up during the busy weeks before Christmas. He sent me a Christmas card all the way from Poland, so, to return the good deed, Jaroslav's next program will be considered for 'Program File'.

## Return match

Peter Cameron of Oxford has solved the problem posed by Mr Bramhall in January's Program File, regarding the scheduling of matches, and has pointed out the elementary and rather embarrassing error in my suggested method of solution. Here is Peter's detailed method:

Consider the case where the number of teams is odd: a *geometric* solution can be obtained as follows. Draw a regular polygon with  $n$  sides and number the vertices (corners). For each round of the tournament, select an edge in turn. The two teams whose numbers are joined by that edge should play; so should all pairs of teams whose numbers are joined by a diagonal parallel to the edge. This leaves one team opposite the chosen edge, which is given a bye in that round. Then proceed around the polygon with each edge in turn to get  $n$  rounds. (This method was taken from Robin Wilson's book,

## Guidelines for program listings

*PCW* is interested in publishing quality programs written in any of the major programming languages for all popular home and business micros. When submitting your programs, include a disk or cassette version of your program, comprehensive documentation and a clear, dark listing on white paper.

The listing should be no more than 80 characters wide and, if possible, sample output from that program should be included. Ensure that you have marked the software, listing and documentation with your name and address, program title, machine (along with any minimum requirements) and a daytime telephone number.

We will be including some of the programs published in Program File in the *PCW* Disk Library. If you have any objections to your program being included, please indicate them, otherwise it will be assumed that the program can be included in the Disk Library. A total royalty of 50p is paid per disk sold from the disk library. The sum is shared among the authors of the programs on the disk.

Here are some guidelines for submitting programs. Check through previous Program Files to see the sort of programs we prefer. Original ideas are always welcome, as are good implementations of utilities and applications. Obviously the programs should be well-written, easy to understand and preferably not too long. All programs should be fully debugged and must be your own, original, unpublished work.

We will try to return submissions if they are accompanied by an appropriate stamped, addressed envelope, but please keep a copy of everything. Programs are paid for at the rate of £50 per page of published listing, plus a £50 bonus for Program of the Month.

Send your contributions to Owen Linderholm, Program File, *PCW*, 32-34 Broadwick Street, London W1A 2HG.

## PCW Disk Library Catalogue

Here is the list of programs currently available: the disk number is given first.

IBM PC 5.25 inch 360K		
IBM5-OCT87-0001	Oct 87	MBasic Molecular Models Create and display correct 3D molecular models
	Sept 87	MBasic MSDOS File Manager Access files via a menu system with password protection
IBM5-APR87-0002	Apr 87	Turbo Pascal Circuit Validation Create and analyse logic circuits on screen in graphics
	Apr 87	PC/AT CMOS RAM Editor Examine and modify the AT's CMOS RAM
IBM5-SEP86-0003	Sept 86	Turbo Pascal Logiprolog Interpreter for simple version of Prolog
	Aug 86	Turbo Pascal Sideways Printer Print things out sideways on the printer
IBM5-JUL86-0004	Jul 86	Turbo Pascal 6502 Emulator Run 6502 code on your PC. Can run the BBC Micro OS!
	Feb 86	MBasic Expert System Powerful expert system shell
IBM5-NOV87-0005	Nov 87	Turbo Pascal Menus Front end menus for programs and DOS in Turbo
	Sep 87	Graphics Algorithms Very fast graphics routines in assembler and Turbo
IBM5-FEB87-0012	Feb87-Apr 87	Teach Yourself Prolog Programs from the teach yourself Prolog series
IBM5-NOV87-0015 Nov 87 MBasic Number Pursuit Educational arithmetic game based on Trivial Pursuit		
	Dec 87	Turbo Pascal Circuit2 Design and layout circuit boards (with disk 2 above)
BBC Micro (single sided/single density 100K disks)		
BBC1-JUL87-0006	Jul 87	Artwork Fully featured painting program, icon based
	Mar 87	1d Cellular Automata Investigate a fascinating mathematical world
BBC1-NOV87-0013	Nov 87	*USE Text file display and search utility for help files
	Nov87	Empty Drive Checks if a drive is empty, works with most DFS's
Apple Macintosh single sided disks		
MAC--JUL87-0007	Jul 87	Worm Plotter Unusual mathematics based patterns
	Jun 87	Excel Macros Derive rules from tables of data using Excel
MAC--DEC86-0008	Dec 86	Mac Mandelbrot Mandelbrot program with a new, fast plotting algorithm
	Mar 86	Mac Fractal Create realistic 3D landscapes using pseudo fractals
Atari ST single sided disks		
ST---JAN87-0009	Jan 87	Darwin's Lens Investigate natural selection (black and white)
	Sept 86	Super Breakout The old favourite in black and white
Amstrad PCW single sided disks		
PCW--JUN87-0010	Jun 87	Mailout Mailmerge program for LocoScript
	Jun 86	Touch Typing Tutor How to untangle your fingers...
PCW--NOV87-0014	Nov 87	Kong Donkey Kong game written in Basic - design screens!
	Dec 87	File recovery Menu driven undelete program - good and class
Amstrad CPC single sided disks		
CPC--AUG87-0011	Aug 87	Adventure Creator Superb text adventure creation system
	Nov 85	Amsquill Powerful and fully featured word-processor

## WHY PAY MORE?

Public Domain Software  
and Shareware

**£2.75 per disk**

Fully inclusive

Send large SAE for catalogue or send £3.00 for a special **STARTER KIT** which includes catalogue and the **PC SURVIVAL KIT** a superb collection of simple to use programs and utilities including: **Galaxy Word Processor, Memory Resident DOS Help galaxy word process memory resident DOS help and 20 Essential Utilities.**

1000's of programs of all kinds business and leisure. All the latest and best programs and versions. We try to give the **BEST VALUE** for money. **FREE DISK** with every seven bought. **NO MEMBERSHIP FEES** to pay.

Please make cheques/PO's payable to **Kingsway Computer Services, Disk and Data Recovery Service.** Also Commercial Software at Low Prices. Please write or phone for details

**KINGSWAY COMPUTER SERVICES**  
140 Rushdale Road  
Sheffield S8 9QE. Tel: 0742 588429

## EALING COMPUTER CENTRE

All models on Display. Retail & mail order

**NEW OPUS PC**  
PCIII SF £499. PCIII TF £609.  
PCIII HD 30Mb £995  
NEW PCV/AT 30Mb £1295  
EGA UPGRADE £300

**STAR PRINTERS**  
LC10 (IBM/CENTR) £174  
NX15 (IBM/CENTR) £295

**ATARI ST**  
520STFM £249  
1040 STF £348  
(limited stock)

**19 Queens Parade, Ealing,  
London W5**

**Tel: 01-991 0928**

**All prices excl VAT**

We welcome education & government discount enquiries

Authorised dealer

**ATARI** **Opus** **the star**  
Power Without the Price™ PC COMPUTERS PRINTERS FOR BUSINESS

## THE NEW OLIVETTI PC RANGE

Available now! The Olivetti M15 portable, M240 (8086) M280 (80286) and M380 (80386) personal computers. We also offer a wide range of printers and other add-on devices and most software packages.

**Call us for prices and literature.**

## 1MB RAM-AT+super EGA £599.95 + VAT

This superb 80286 AT compatible system includes:

- 12MHz 80286 CPU (switchable from 12MHz to 10, 8 and 6MHz).
- 1 Megabyte of RAM (640k+384k split).
- Genoa Super EGA card (resolution up to 640 x 480).
- Real Time Clock, RS232, parallel and printer port.
- High quality 102-key UK keyboard (ATE layout).
- Legal PHOENIX BIOS.
- Microsoft DOS 3.2.
- One Year Guarantee.

## Introduction to Graph Theory.)

This method can be represented by a simple formula. Number the teams from 0 to n-1. Team 'i' has a bye in week 'i' (for real-life purposes, week 0 is the first week). Teams i and j play in week  $(i+j)/2$  if i+j is even, and week  $(i+j+n)/2$  if i+j is odd. Then, to find team i's opponent in week 'k', calculate  $2k-i \pmod n$ .

A similar procedure for even numbers can now be obtained. The number of teams should be n+1 where n is odd (one less than the number of teams). Temporarily remove a team from the pool and schedule an n week tournament for the remaining teams as described above. Finally, for each week i, add back in a match between team i and the team you temporarily removed.

This is an extremely elegant and straightforward solution. I apologise

to all those readers who followed my suggestion up blind alleyways.

## This month's programs

The Program of the Month, written by MDR Croning, is for the Atari ST and is simply called Chaos. It has been written in Fast Basic and explores plots based on chaos theory as described in the article 'From chaos to beauty', PCW, November 1987. The program uses GEM fully and event-driven programming - the natural way to write programs for WIMP environments. The program only runs on black and white systems, but it shouldn't be too difficult to convert to colour.

Other programs are for the Amstrad CPC and PCW, including a typing game and a file recovery program. A wide variety of other machines are also represented.

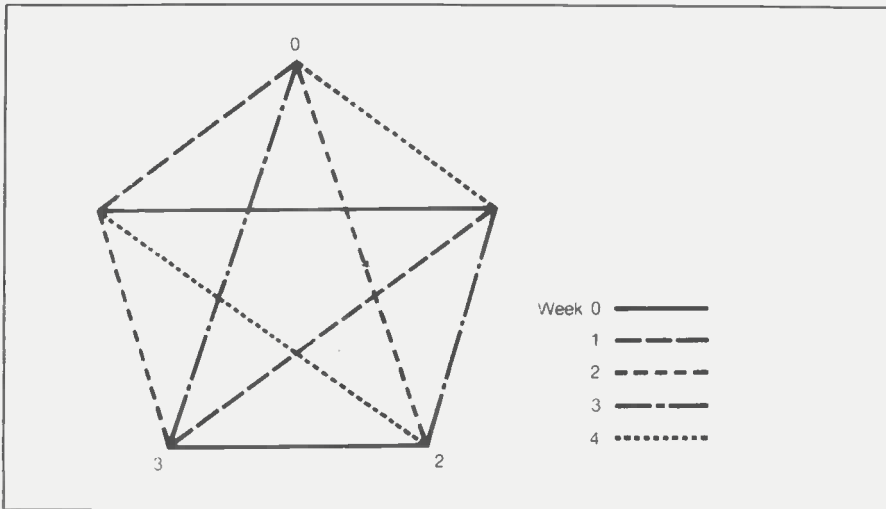

Diagram for Peter Cameron's method

## Program of the Month ST Fast Basic Chaos by MDR Croning

This program is for a mono-screen ST and has been written in Fast Basic. It explores the creation of 'chaos' plots and is based on the article 'From Chaos To Beauty', PCW, November 1987.

The program uses the GEM environment to create plots in a window so that plots much larger than the screen size can be created and examined. On a 512k machine, plots up to 890x890 pixels can be displayed. Plots can be loaded from and saved to disk and printed to a C.Itoh-compatible printer. It shouldn't be hard to convert the program for other printers.

Function keys are used to select the various modes of the program:

**F1** — loads in a saved plot file.

**F2** — saves the current plot to a disk file.

**F3** — starts a plot once initial parameters have been set up, or continues an interrupted plot.

**F4** — allows you to set up initial values for the three seeds for a plot and the magnification at which to display it.

**F10** — quit.

**HELP** — interrupts a plot so that it can be saved or a new one started.

When the program has been typed in, its workspace should be changed to 150k from the 'Show Info' option in Fast Basic. If more memory is available, then increase this and the size of the variable 'picbuffersize%' in 'PROCinitvariables'.

Here are details of the PRINT

### BUTTONWARE FOR THE IBM PC

**PC-File+** — The latest version of PC-File which will still read all your PC-File III/PC-File/R Files as well as exchanging data with other programs such as Visicalc, dBase II/III, Lotus 123 and many others. PC-File+ is easy to use with over 175 help screens, extensive sorting and searching options and user defined entry and report screens.

**PC-Type+** — A fast and easy to use word processor which comes with a 100,000 word spelling checker, undelete key, macros, search/replace on-line help, sorting, mail merge and many other facilities. Works with PC-File databases.

Each program comes with extensive documentation, is fully supported and costs £49.95 (+VAT). These are the official U.K. versions rather than share ware or cheap U.S. imports. Please send your order and cheque, or write for further information to:

ASHGATE LTD, UNIT 8, BUZZARD WORKS,  
BILLINGTON ROAD, LEIGHTON BUZZARD,  
BEDS., LU7 8TN. TEL: (0525) 383274

### PROLOG TOOLKIT

An invaluable aid to anyone writing Prolog software. Developed by practising Turbo Prolog programmers to provide practical examples of many commonly used routines including:

Maths Functions	String Manipulation
List Manipulation	Database Support
Mouse Support	File Access Methods
Searches	Hardware Support
Binary Chop	Keyboard Utilities
Sorts	Financial
Statistics	Curve Fitting

All examples supplied as fully documented Turbo Prolog source code complete with demonstration facilities. Developed in Britain by Aldex Software and bears no relation to any other manufacturer's product

Only £55 (+VAT) from

### ALDEX SOFTWARE

Portland House, 6 High Street,  
Sutton, Ely, Cambs CB6 2RB  
Tel: 0353 778012

Runs on all PCs with Turbo Prolog and 512k RAM.  
Turbo Prolog is a trademark of Borland International, Inc.

## PROGRAM FILE

routine so that it can be altered for other printers:

**OUT 0,27,112** — sets the printer to 1152 dots/line (144dpi).

**OUT 0,27,84,48,49** — sets linefeeds to 1/144in to get a 1:1 aspect ratio.

**OUT 0,27,76,"X"** — sets left column to X\*16 pixels from left of paper (used to centre picture on paper).

**OUT 0,27,71,"N"** — prints N dot positions of 8\*1 graphics.

The printer then waits for n bytes of data to print out the line. The actual data output to the printer is

either 0 or 1.

The file format used for saving pictures (\*.FRT) is very simple: bytes 0-1 are the width of the picture (16-bit); and bytes 2-3 are the height of the picture (16-bit).

The remainder of the file is picture data using all eight bits of each byte. The number of bytes per line is dependent on the number of pixels per line. The actual bit format mimics that of GEM rasters — the low bit of each byte is the right-most pixel held by that byte in the plot.

# TRAINING

## COMPUTACENTER TRAINING

Computacenter Training is a nationwide specialist division of Computacenter offering structured courses on all major standard micro computer products.

The courses range from Introduction for new users, through Intermediate for existing users of a product to Workshop level for the more advanced features.

Each of our training centres are fully equipped with one system per delegate ensuring maximum learning during each training course.

### FOR FURTHER INFORMATION

## Amstrad Training – £29.95!

With so many organisations trying to sell you on their training courses, you need to be selective. And if price is important too, the choice is simple – you need Reel-Time.

No other training course can offer: personal tuition; disk-based tutorials; a full set of course notes on disk; and a wealth of practical extras, all for just £29.95+VAT.

Best of all, your Reel-Time course is delivered to you pre-recorded on audio-cassette and disk. The whole course is yours to run on your own computer, at your own pace, and repeat whenever you like.

**IBM range:** • Amstrad PC (1512 & 1640); • IBM/Comps (PC/XT/AT); • SuperCalc (for 3 & 4); • dBase II; • WordStar (3.3) • Desktop Publishing;

**PCW range:** • Amstrad PCW 9512 (& Locoscript 2); • Locoscript (PCW 8256); • The PCW Computer (for 8256/8512); • SuperCalc 2; • dBase II; • WordStar Professional (3.3); NewWord 2.

### Call today – Learn tomorrow!

Head-Line Communication Limited  
P.O. BOX 22, HEREFORD, HR4 8UW  
(Orders/enqs) Tel: (0682) 603623.

Ask for a full list of our courses for IBM/Amstrad computers and software.

## TRAINING AND COMPLETE SYSTEMS

### OR HOW TO MAKE YOUR MICRO WORK FOR YOU

We train everyone from the MD down. Our courses may take place at your offices or at our training centre in Kensington. After the course you may call us free of charge for help or advice.

Where training is not the whole solution, our software development team is on hand to put together complete systems taking care of every aspect from machines to maintenance.

## NEWS

### FOR ATARI ST SUPER-CHARGER

Hardware based MS-DOS Emulator

- ✓ FULL IBM COMPATIBILITY
- ✓ STAND ALONE 8086 COMPUTER
- ✓ EXPANDABLE
  - 80286, 80386 CARD
  - HD/FD controller with cache
  - serial/parallel card
  - Modem card
  - Control bus card
- ✓ SUPPORT OF NUMERIC COPROCESSOR 80387
- ✓ reliability due to the use of a special gate array
- ✓ FAST DATA TRANSFER USING THE ATARI HD PORT
- ✓ SUPPORT OF ATARI PERIPHERALS
- ✓ IBM COMPATIBLE DISK FORMAT
- ✓ IBM CGA SUPPORT USING MONOCHROME OR COLOUR ATARI MONITORS
- ✓ MOUSE SUPPORT
- ✓ FUTURE EXPANSIONS
- ✓ PARALLEL PROCESSING
- ✓ MULTITASKING
- ✓ MULTIUSER
- ✓ NETWORK FOR ATARI ST COMPUTERS

Unleash the power of your ST!!  
Run all MS-DOS software real fast

# MICROMART

## The fastest Modula-2 software development system

for

### the IBM PC range & compatibles £ 75

With M2SDS you develop your Modula-2 programs in a powerful window environment, where all the tools are integrated for speed and efficiency:

- syntax directed editor
  - incremental compiler - much faster than a conventional compiler
  - fast linker - produces stand-alone executable programs
  - library manager - modules are compact and ergonomically managed
  - clock, ASCII table, calculator
  - all modules are provided in source form
- M2SDS supports the 8087 maths co-processor, REAL arithmetic calculates to 15 digits accuracy and easy access to the MS-DOS/PC-DOS/Concurrent-DOS operating environment. Programs and data may use up to the full 640K DOS memory. No other software development system has as many tools and toolboxes as M2SDS.

SDS-XP	£ 185
Debugger	£ 70
M2SDS demonstration disks	£ 5
Turbo-Pascal to Modula-2 source code translator	£ 35

## AMIGA £ 115

Extremely fast single-pass compiler, integrated into the Amiga Workbench, full support for documented functions (Intuition, Exec, Graphics, etc.), double-precision numeric types, including FFP, produces optimised machine code, links in just a few seconds! The comprehensive development system contains an editor, compiler, linker, library modules (Standard & Amiga libraries), manual and introductory Modula-2 book. Minimum configuration: 512K, 1 drive. Demonstration disk £ 5

## IBM/370 Mainframes £ 6500

One of the fastest compilers in the world (single-pass, 36000 lines/minute), full 32 bit arithmetic, separate compilation of modules with all the benefits of Modula-2 (version control, type checking between modules, etc.), interface to Assembler and Fortran, support of project libraries, produces high efficient native code (including arithmetic checks) for linker and loader. Annual contract for support £ 1100

## TYPESETTING

with your  
**IBM and AMSTRAD**

from **£1.65** per 1000 characters

Enter your data onto your computer and key in the data, tables etc. in the position you would wish the final typeset version to be, no need to enter special and confusing typesetting commands, our system requires raw text only.

The text is then sent to our page make-up facility where each individual page is made up to your specifications.

We have five years experience typesetting from disk.

### WE SPECIALISE IN

books, magazine typesetting, reports - especially computer manuals and foreign language manuals.

For more information or if you wish to discuss a specific job please contact Kim or Milan at

## KAMSET

34 Rayleigh Road, Hutton, Brentwood, Essex  
Telephone (0277) 218676

## The STATIKILL range of products

Computer cleaning VDU screens, outer casing and keyboards.

Also cleans typewriter keyboards and rollers, TV screens etc.

Other applications  
Audio Visual, Camera, Optical, Litho, Carpets

This is a Bio-degradable antistatic product and physiologically safe to use in any environment. It is completely odourless and safe to use on all types of plastics, metals, glass, wood and polished surfaces.

\ wtitle% - address of start of window title (80 bytes)

\ desk(11) - holds object tree of desktop
\ pbf(23) - parameter buffer for WAITEVENT
\ mbf(8) - message buffer for WAITEVENT
    
```

## PROGRAM FILE

```

\ scb&(9) - screen mfdb for BLIT
\ pib&(9) - picture mfdb for BLIT

\ picl - indicates if a pic is in memory (0=yes, 1=no)
\ tpath& - path used in program
\ tfile& - holds filename of picture
\ ptstl - indicates whether assembler routine 'pixeldrawtest' either
\         - draws or tests (1=test)

\ pbwidth& - width of picture in bytes
\ pwidth& - picture width in pixels (always multiple of 16)
\ pheight& - picture height in pixels
\ pposx& - x-coord of point of picture picture
\         - displayed at top left of window
\ pposy& - y-coord
\ picorigx& - x-coord of centre of picture
\ picorigy& - y-coord

\ wwidth& - internal width of window
\ wheight& - internal height of window
\ wx& - x-coord of top left of window (internal)
\ wy& - y-coord
\ wndl - window handle
\ wextw& - external width of window
\ wexth& - external height of window

\ hssize& - horizontal scroll box size
\ vssize& - vertical scroll box size
\ hspos& - horizontal scroll box size
\ vspos& - vertical scroll box size

\ T - 1/SQR(2) - constant used in rotating picture through 45 degrees

\ lwn%=0 - variable used to pass number of bytes/4 to assembler
\         - routine 'clearmem'
\ maddr% - memory address to start clearing for 'clearmem'

\ genl - indicates whether picture is being drawn (0=no, 1=yes)
\ initl - indicates whether picture has been initialised
\         - i.e. seed values + mag entered

\ flag% - flag used by fselect to indicate whether [Ok] or [Cancel]
\         - was clicked on at end of FSELECT

\ fkey& - variable used to hold value of function key pressed
\         - used by 'errorinstall'

\ frtA - Three seed values for drawing picture
\ frtB -
\ frtC -

\ frtx - x-coord of last point created by 'PROCdraw'
\ frty - y-coord
\ frtxx - x-coord of point being generated by 'PROCdraw'
\ frtyy - y-coord

## Amstrad CPC Rescue by David Brewer

Have you ever lost hours of work when your program has crashed? Even the best commercial software contains bugs, and if you have tried your own machine code programming you will, like me, have grown to dread the sudden appearance of the warm-up screen.

Rescue is at hand, however, if you own a CPC6128, or a CPC664/464 with a memory expansion. This program will save the contents of memory with memory expansion. This program which hides in the background of your computer, and keep it safe in case you crash. If (or when) you

# MICROMART

## Farsight £99

is not only a Lotus 1-2-3 clone but an integrated system which includes a spreadsheet that is fully compatible with Lotus 1-2-3 and many extra features, such as: windowing system which allows several spreadsheets to be open simultaneously, extended search function, direct interface to the word processor, etc.

The word processor is highly efficient, fast, easy to use, comprehensive, 10 different font styles, proportional spacing, as many independently formatted blocks as you want. The word processor is ideal for writing anything from memos to books!

The window manager allows full access to DOS commands. It can drive up to 2 printers as background tasks for maximum efficiency.

Farsight utilizes all the colours/attributes available on your colour or monochrome monitor and offers high speed at low cost!

### Farsight Graphics £ 29

Pie-Charts, bar charts, stacked bars, line graphs, supports all cards including Hercules and EGA.

### Address Manager £ 60

Compatible with Farsight. Addresses are sorted alphabetically or by post-code. For each address you have 10 different criteria for selection + 12 lines of data. The system is quick and easy to use.

## Farsight is written in Modula-2

## **PROGRAM FILE**

crash, Rescue will restore the memory to the exact state it was in when you last saved it.

Type in Program 1, which is a Basic loader. When you run it, any data errors will be pointed out. If there are no errors, it will automatically save the binary program, Rescue, to disk or tape.

To use Rescue, simply load it at any time and then CALL &BF00 whenever you want to save the contents of the memory to the second block of 64k. To rescue the memory contents after a crash, reset the computer with CTRL-SHIFT-ESC, type 'CALL &BF00,1' then ENTER.

When Rescue has been loaded, it will remain in the computer even if you reset it or it crashes, and it will only be lost if you turn the computer off. This means that you do not have to reload Rescue each time your computer crashes or when you reset it with CTRL-SHIFT-ESC.

The program works by saving all the usable memory into the second memory block of 64k, which very few programs use. Obviously, if the program you are using or writing does require the second block of 64k, then you cannot use Rescue. These programs include the better word processors such as TASWORD 128 or rare programs such as MASTERFILE, which run on the CPC6128 but not on the unexpanded CPC664/464.

The second block of memory cannot be addressed directly because the Z80 processor (which is used in all CPCs) can only use 64k at any one time. In order to use any of the second block of memory, some of the original block must be swapped with it so that the total is always 64k. The easiest way of doing this is to swap a bank of 16k of the second block with a 16k bank of the first block.

Swapping memory banks can be done in Basic. The best bank to swap with is the one from &4000 to &7fff. This will not interfere with any Basic programs (unless they are more than 15k long) nor with any machine code programs above &8000. The second block of memory has four banks, and any one of them can be swapped into the first memory block at &4000 with the following short program:

```
10 bank=1: REM or 2,3 or 4  
20 OUT &7F00, 195+bank
```

The original bank can be restored by:

```
30 OUT &7F00, 192
```

This second block of 64k can be used to store data, screens, or, as with this program, the whole contents of the first block of memory. Unlike the first block, it is not cleared when you reset the computer, so in-

formation stored there is not destroyed when your computer crashes. The following lines added to the above program will put your name into the second block of memory so that it can then be rescued after you have reset the computer:

```
24 INPUT "Name:", n$:FOR n=1 TO  
LEN (n$):POKE &4000+n, ASC  
(MID$(n$,n,1)): NEXT
```

```
26 OUT &7F00,192
```

Run this short program, then reset the computer with CTRL-SHIFT-ESC. Run the following program to recover your name:

```
10 bank=1: REM (or whatever number  
you used before)  
20 OUT &7F00, 195+bank  
30 p= PEEK(&4001+n):IF p<123  
AND p>31 THEN PRINT CHR$(p);  
n=n+1:GOTO 30
```

The machine code listing of Rescue shows how this bank-switching is done in machine code. What Rescue does is to copy each of the four banks of the first block of memory into the corresponding bank in the second block, and then copy them back again. For example, the first step is to place the fourth bank of the second block into memory at &4000, then to copy the contents of the fourth bank of the first block (&C000 to &FFFF) into &4000-&7FFF. This effectively copies the screen (which occupies &C000-&FFFF) into bank four of the second block, so, by studying the listing, you should be able to work out how to save more than one screen and how to call them back.

With a bit of ingenuity, you should also be able to work out how to adapt this program to grab protected programs out of memory and to save them to disk or tape, but I had better not encourage you!

When all the copying and swapping of memory banks has finished, the original bank is restored and the screen mode is set. The only part of the memory which is not copied into the second bank is &BF00-&BFFF, which is where Rescue lies.

Rescue has been placed in the memory at &BF00 because this is not affected when the computer is reset. The area of &BF00 to &BFFF is reserved for use by the stack, but the bottom end of this space is very rarely used. If your program uses so much stack that it overwrites Rescue, then it is likely that it has gone into a continuous loop of CALLing or PUSHing values into the stack. If this happens, CALL &BF00,1 will not restore your crashed program until you have reloaded Rescue.

Now you can hack without a care. If you crash, Rescue is at hand.

## QL File Analyst

by David Marsh

File Analyst analyses all parts of a SuperBasic file and generates a report on the file to the screen or printer. It will only analyse those parts of a program that you want it to — for example, you could analyse FOR...NEXT loops only.

The program uses a menu system with a menu bar controlled by cursor keys, and operations are selected by pressing ENTER. When you have chosen a file to analyse, the options available are:

**SEARCH WORD** — scans for all occurrences of a word and reports.

**SEARCH/REPLACE** — finds all occurrences of a word and replaces them with a new word.

**SEARCH INTEGERS** — scans for all variables used as integers.

**SEARCH STRINGS** — scans for all string variables.

**SEARCH REPEAT LOOPS** — scans for REPEAT loops and reports the start and end of each loop.

**SEARCH FOR LOOPS** — does the same for FOR loops.

**SEARCH PROCedures** — scans the program for all PROCedure declarations.

**SEARCH FuNctions** — scans for functions.

**SEARCH SElects** — searches for selects.

**SEARCH IF THEN** — scans for IF statements.

**QUIT ANALYSER** — quit and return to SuperBasic.

**DIRECTORY MDV1/MDV2** — gives a directory of MDV1/2.

### Mr Retailer Retailers Point of Sale System

#### Now

All the benefits of Point of Sale enjoyed by the Multi  
Nationals without the prohibitive cost.

Replace your till with a modern computer, as the BIG  
MONEY EARNERS DO.

all Bookkeeping instantly updated. Immediate access to  
completely updated Stock records. VAT returns at the  
press of a key. Even a complete Double entry Balance  
Sheet available instantly.

All this up to date at the moment you press the key to  
put your money in your up-to-date till.

The Retailers Dream is Now a reality! Mr Retailer is the  
complete solution to your headaches and at a  
FRACTION of the cost. The same type of programme is  
costing the big boys vast sums of money.

#### Mr Retailer Software System

ONLY £495. Dealers required

Complete Mr Retailer system with High quality  
Tandon 20 Meg Hard disk computer, printer etc  
£1700. Electronic cash draw available  
All prices plus VAT

# Psion Organiser Utilities

by Chris Shaw

This program contains two Psion Organiser utilities for use with the Comms Link. The first, PDIR, transfers a directory of all the types of file in RAM down the Comms Link to a printer or PC. The second, DUMP, formats and transfers the contents of selected areas of memory down the Comms Link for analysis. The impetus for writing them was given when Psion's Technical Support department stated that it was not possible to list the user procedure names.

The first stage was to create the DUMP program which produces a formatted hex and printable character listing of the contents. This program was used to discover the procedure heading structure so that a routine to list a directory of the files could be written. So far, I have not been able to extend PDIR to access filenames on Datapacks: suggestions would be welcome.

## General notes on PDIR

Data file names can be accessed using the OPL string function DIR\$. The built-in filetypes for procedures, diaries and spreadsheets are recognised by a characteristic 'initial word':

DIARY FILE — £0982  
 PROCEDURE FILE — £0983  
 COMMS LINK SETUP FILE — £0984  
 SPREADSHEET FILE — £0985

The word at memory location £2006 contains the address of the end of the 'active' diary. This address is then used as the start address for the next file. If the initial word contains £FFFF, this denotes that there are no more files. Records of the user-procedure created data files are held as character strings. For these types, the initial word comprises a length byte and a file identifier byte. When PDIR encounters this type of record, it increments the memory address until the next initial word is found.

An address limit is used to prevent the routine reading the machine stack area of memory. This limit should be adjusted according to the type of Organiser available:

Model CM, limit=£3F00  
 Model XP (16k), limit=£5F00  
 Model XP (32k), limit=£7F00

Note that you don't need to, and shouldn't, type in the REMarks.

```

## HEAD COACH v3

At Coda Software we believe we have created the most challenging and realistic computer simulation of American Football that is currently available. "HEAD COACH v3" is a direct simulation of the National Football League and offers you the opportunity to coach a team in the world's toughest league. Here are some of the features:

- PLAYBOOK FEATURING OVER 40 OFFENSIVE AND DEFENSIVE PLAYS
- FULL ROSTER OF PLAYERS
- DATABASE OF ALL N.F.L. TEAMS
- PRE SEASON/REGULAR SEASON/PLAYOFFS AND SUPERBOWL
- ABILITY TO CHANGE YOUR TEAM DURING A MATCH
- INJURIES AND TRAINING CAMP
- ROOKIE PLAYERS AND THE COLLEGE DRAFT

But don't just take our word for it, read what previous satisfied customers have said:

- "absolutely amazed by the realism" — J.H. Twickenham
- "Excellent" — S.H. Northants
- "I am now addicted to the game" — R.C. Lincs
- "Superb" — N.E. Essex
- "Software and presentation are excellent" — O.F. Bushey

The Database of players and information on all teams which makes "HEAD COACH v3" so realistic, can easily be altered by the user if and when necessary to keep the game fully up to date. However, as a service to all new CODA SOFTWARE customers, we are offering regular information updates FREE OF CHARGE.

### Note

The sample DUMP output shows the "initial word" for procedure filename Q (see PDIR output sample above) located at address #590D. Procedures are held in memory as the translated version immediately followed by its source code. The next item in memory is the spreadsheet filename JPNX (see above). The initial word for this file is held at address location #5A53.

## Commodore 64 Toolkit by Obbe Vermeij

This Commodore 64 program is a toolkit that provides a grey bar across the screen which follows the cursor on each line. This makes it easy to find the cursor when entering data. Each key clicks when pressed,

also to make data entry easier. The program provides a second screen which can be used for notes without affecting your normal screen.

Full instructions are provided with the program.

```

## Amstrad PCW Nimble Fingers by Gerard Browner

Although a full-blown typing tutor has appeared in Program File in the past, these programs are generally a bit too 'ordinary' for part-time typists

or cannot help in brushing up on rusty skills. This simple game is a brave attempt, however. Simply type in the listing, save it and run it.

```
5 ' Filename Nimfing.bas
15 ' *****

## MICROMART

### READ & PRINT BAR-CODES USING ANY COMPUTER

Complete identification system including microprocessor controlled scanner hardware plus software to print barcodes on Epson (or similar) dot matrix printer. Most industrial & commercial codes can be read. Packages available for virtually any computer. Our systems are in regular use by many private & public sector organisations worldwide. Prices start from £250. More information on request.

## PROGRAMMERS!

SAVE HOURS OF PROGRAMMING TIME  
EACH WEEK WITH THE  
VICAR

A powerful source code indexer for anyone programming on a micro. Puts all identifiers from multiple source files into one sorted listing, prints complete context line for each occurrence, showing instantly what the variable is doing. Lots of control options.

Versions	Implementations	Price
BASIC	Microsoft, IBM, GW, Quick, Mallard, Turbo, BASIC2, ZBASIC (runs under CP/M & MSDOS only)	£49.00
BBC BASIC	ANSI, K&R, Lattice, Living, Microsoft, Turbo, Mix, Zorland, Windows Toolkit	£49.00
C	Microsoft, Turbo, Mix, Zorland, Windows Toolkit	£129.00
C-BASIC	Interpreter Compiler	£79.00
Cobol	CIS, Level II	£129.00
dBase III	dBIII Plus, dBII, Clipper, dBMan, Foxbase, Quicksilver, dCE	£129.00
dBase II	dBMan	£79.00
Fortran	Microsoft 66 & 77	£79.00
Pascal	Prospero, Microsoft, Turbo	£79.00
Turbo Pascal	Database, Graphix, Editor, Lighting WW Toolboxes	£49.00
ZIM		£129.00

### VICAR

Variables In Context Analyst & Reporter available for practically all MSDOS & CP/M micros.

MicroCom Systems  
**OUTSTANDING SOFTWARE**  
For IBM PC's and Compatibles

£ 350 PER DISK  
SMALL QUANTITIES

£ 300 PER DISK  
FOR TEN OR MORE

£1 OFF 5 DISKS OR MORE WITH THIS COUPON

- BUSINESS 1**—EZ-Forms business form generation, completion and printing program.
- CAD 1**—Altamira, a 4 color object oriented drawing program. Color required.
- COMM 4a,b,c,d,e**—(5 disks) RBBS Bulletin Board System 14.10.
- DATABASE 1a,b**—(2 disks) File Express menu driven general purpose database mgr.
- EDUCATION 1**—Interactive DOS tutorial for new PC users. Makes learning DOS painless.
- GAMES 1**—3-D PacMan, Kong, SpaceWar, JanitJoe, and more. Color required.
- GAMES 2**—Qubert, Pango, Centipede, Monopoly, Zorrie, and more. Color required.
- GAMES 3**—Blackjack (you set rules), Arm Chair QB, and Empire (War Game).
- GAMES 4**—Castle, StarTrek, and the original Colossal Caves Adventure.
- GAMES 5**—The Hack adventure game from the universities. Like Rogue, only more complex.
- GAMES 6**—Pinball, Othello, Dragons, Sopwith (fly one), and more. Color required.
- INFO 1a,b**—(2 disks) Cooking recipes database with keyword/ingredient retrieval.
- LANGUAGE 5**—Turbo Pascal interactive debugger, pop-up help, formatters, et cetera.
- LANGUAGE 7**—Complete Pascal interpreter/compiler. Great for learning Pascal!
- ORGANIZER 1**—DeskMate, a Sidekick clone, and the Judy calendar program.
- PINUP 2**—Provocative high res digitized graphics pinups. Graphics required.
- PRINTER 1**—Font and sideways utilities, spoolers, banner makers, and more.
- UTILITIES 1**—A collection of invaluable general purpose DOS utilities. A must!
- UTILITIES 2**—More invaluable DOS utilities. Too many to list here!
- UTILITIES 3**—A comprehensive set of debugging and diagnostic utilities.

**NEW RELEASES/UPDATES**

- CAD 2a,b**—(2 disks) An advanced 2D/3D drafting prog. 640k and color required.
- COMM 1a,b**—(2 disks) Version 2.4 of the ever-popular Qmodem comm. program.
- COMM 2a,b**—(2 disks) Procomm 2.42, an excellent modem program with terminal emulation.
- EDUCATION 2**—Learn the Presidents, States (and capitals) and more. Color required.
- EDUCATION 5**—Learn Origami, the Japanese art of paper folding. Color required.
- FINANCES 3a,b**—(2 disks) Express Calc 3.12, a powerful spreadsheet program.
- GAMES 8**—Striker helicopter attack, and Risk, world domination. Color required.
- GAMES 9**—EGARisk, the game of world domination in very high resolution. EGA required.
- GAMES 10**—Solitaire, Teed-Off golfing, and Sailing in the Bermuda triangle. Color required.
- GAMES 12**—MyChess (9 levels), Backgammon, and Wheel of Fortune. Color not required.
- GRAPHICS 1**—Record and play back screen images! Excellent for demo, etc. Color required.
- INFO 2a,b**—(2 disks) Zip-Phone, national areacode/ prefix to zip-code cross reference.
- LANGUAGE 3a,b**—(2 disks) The A86 2.18 macro assembler and debugger.
- SHELL 4**—Automenu and HDM II 4.04 hard disk menus. Create custom full-screen menus.
- UTILITIES 5**—Utilities for formatting, parking, and optimizing hard disk drives.
- UTILITIES 6**—Advanced utilities including Dpath, Esc, Hotdos, Resident program utilities.
- UTILITIES 7**—More Advanced utilities including MasterKey (undeletes files from hard disks).
- WORD 1a,b**—(2 disks) PC Write 2.7, a powerful word processing system, w/spell checker.

Catalog available, add £2. 3.5" format add £1/disk.

## £3 SOFTWARE

All disks are for the IBM-PC, and compatibles, and are priced at only £3 per disk.

SOFTWARE	Description	Price
<b>WORD-PROCESSORS</b>		
PC-Write	Excellent and extensively documented	1 disk
Chewstar	Multi-font word processor	1 disk
NY-Word	With macros, mailmerge, windows etc	2 disks
Galaxy	Wordstar compatible, with windows etc	1 disk
Spell	Fast spell-checker for most WP's	1 disk
PC-Outline	Fast outliner, windows, can be resident	1 disk
<b>LANGUAGES</b>		
Forth	FR3, with built-in editor and compiler	1 disk
Lisp	XLisp, Ver 1.5, Art. Intell. language	1 disk
Prolog	Ver 1.8 The best of the A.I. languages	1 disk
Pascal	Excellent general programming language	1 disk
Fast Tools	Just what it says, and top class tool	1 disk
"C" Library	Routines, aids, and utilities for "C"	6 disks
Windowing	Windowing tools for BASIC and "C"	1 disk
Assembler	Fast, powerful macro assembler	1 disk
<b>DATABASE MANAGEMENT</b>		
PC-File III	Calculating database with graphing facility	2 disks
PC-Rm	Enormous. Ported from mainframe (hard disk)	3 disks
FreeFile	User friendly, powerful 2 billion records	1 disk
Wampum	Fully Base III compatible database system	2 disks
<b>GRAPHICS</b>		
Graphics 3	Some of the best of the PD Graphics progs	1 disk
Icons	Creates Icons, Symbols, Logos, etc	1 disk
CAD	Powerful colour design programme	2 disks
Dancad3D	Full 3D Engineering design system	4 disks
<b>GAMES</b>		
Arcade	Collection of 8 fine arcade games	1 disk
Arcade 2	More great arcade games	1 disk
Chess	All the best versions	1 disk
Mumpsy	The great classic. Bankrupt your micro	1 disk
Pinball	3 superb pinball tables here	1 disk
Flightmare	Simply the best game we know of	1 disk

BBD  
DUST  
COVERS

## PROFESSIONAL DUST COVERS

BBD  
DUST  
COVERS

Protect your new investment with a dust cover from the BBD Professional range.

Every BBD cover is made from top quality tear proof and water resistant nylon fabric which has been coated with polyurethane to which an anti-static inhibitor has been added.

Choose from a wide range of covers, each manufactured to the same uncompromised level of quality and featuring colour co-ordinated piping so that even the most diverse array of office machinery will be elegantly protected by a matched set of BBD Professional covers.

Why not send for our price list and see how BBD can be of service to you.

**BBD COMPUTER DUST COVERS**

## COMPUTER REPAIR SERVICE

### ★ Special Offers ★

Amstrad CPC 464.....	£25
Sinclair Spectrum + .....	£18
Acorn BBC B.....	£27
Commodore 64.....	£20
Amstrad PCW 8256.....	£30
Atari 130 XE.....	£20
Atari 520 ST.....	£27
CBM disc drive.....	£25

All prices include parts and labour

Come along or post with payment.

Please phone before posting.

## WYNTER ELECTRONICS

Unit 30F Atlas Village  
Oxgate Lane  
Staples Corner  
London NW2 7HU  
Tel: 01-452 5660

We also upgrade units — please phone for details  
Free keyring with every repair

## CALLING ALL GARDENERS!

Plan your garden more effectively by selecting the right plants for every location and purpose.

Only **£29.95** (+ £1.60 P&P)

★ Select the type of plant you want and the conditions where it is to grow from over 40 different categories including foliage colour, height, flower arranging, cottage garden, easy to grow and scented.

★ Suitable plants are automatically selected from an extensive database of 2,000 named plants including many choice and unusual specimens.

★ Plant descriptions, including growing requirements, can be displayed for the list of selected plants or for named plants on demand.

★ PLANT SELECTOR is informative, useful and fun to use.

★ If you have a garden, PLANT SELECTOR is a *must*.

Please make cheques payable to

### ALDEX SOFTWARE

Portland House, 6 High Street, Sutton,  
Ely, Cambs CB6 2RB Tel: 0353 778012

Runs on all IBM compatible MSDOS computers (inc. Amstrad) with 512k RAM.

## COMPUTER REPAIRS (UK)

Repairs to most makes of micro computers and computer peripherals

- ★ Fast turnaround
- ★ All repairs guaranteed
- ★ Trade contracts
- ★ Competitive rates

## Neural Networks Listing

by Jack Weber

PCW  
DISK  
LIBRARY

This is the listing which accompanies Jack Weber's article 'A window on the brain', on page 130 of this issue. It has been written in Microsoft

Basic for the Apple Macintosh, but shouldn't be too difficult to convert to other languages and machines.

Neural Network Associative Memory  
© Jack Weber - November 1987

Constructs fully connected bidirectional associative memory  
Variable size neuron layers  
Iterates until stable  
Visual input/output

Runs on Apple Macintosh under MS Basic v3.0 with Toolbox Library

```

ON BREAK GOSUB Quit
GOSUB Initialise
net:

## LASERSETTING SERVICE

Printing • Layout • Production

**Lasersetting**  
Cheaper than typesetting, faster than any standard computer printer. 300 dots per inch. Wide range of typefaces.

**Full production service**  
Colour / black & white printing, finishing, binding

**Design service**  
Layouts, original artwork, paste-ups, camera-ready copy

**Copy writing**  
Experienced technical and marketing writers on hand.

**Disk and Tape conversions**  
We can accept text on over 1,000 disk and tape formats, as well as offering a keying-in service. We also run a comprehensive disk conversion bureau, starting at £10 per disk + VAT.

**Scanning**  
Service for photos and artwork. Typereading also available.

**Fast printouts**  
Straight dumps from disk to paper. Up to 450 pages / hour. From 25p / A4 page.

**See for yourself**  
This advert was laser-set in-house. Call us now for a quotation.

25p/page lasersetting  
£25/hour layout.  
£15/hour word processing.

**A.I. DOWNLOADING SERVICES**

## SOFTWARE THAT SPEAKS YOUR LANGUAGE

Multi-Lingual Scholar™, word processing and font editing software for the IBM PC or compatible. All characters display on screen with accents, vowel points, diacritics and print (highest quality!) on most dot matrix and laser printers with no hardware changes to computer or printer. Arabic and Hebrew type from right to left, and Arabic characters change shape automatically as you type.

Basic package: US\$350 + 20 airmail shipping, prints on dot matrix printers. Add US\$150 for laser printer support. (Demo US\$22 uncludes airmail.) Includes: Arabic, Bulgarian, European (also Eastern Europe), Greek, Hebrew, Latin, Persian, Russian, Scandinavian, Serbian, Turkish, Ukrainian, Urdu, Yiddish. Plus one free optional language: Bengali, Gurmukhi, Hindi, IPA, Khmer, Sanskrit, Tamil, Thai, Vietnamese. Additional languages: Amharic, Aramaic, Armenian, Assyrian, Coptic, Phoenician, Syriac, Ugaritic — please inquire.  
 Requires IBM PC/XT/AT or PS/2 or compat, graphics (monochrome or color), 640k, 1 parallel port.

Payment by VISA/MC/AMEX or draft in US dollars payable on an American bank.

**Gamma Productions, Inc.**

710 Wiltshire Blvd, Suite 609, Sana Monica,  
 California 90401 USA.  
 Tel: 213-394 8622 Tlx 510 600 8273 Fax 213-393 7608

Dealer/Distributor inquiries welcome.

## PROGRAM FILE

```

c%      Array - holds connection weights between all pairs of neurons
choice% Choice of training or testing as selected by radio buttons
col%    Colour being painted - white = 30, black = 33
diff%   Number of neurons changed in current calculation
done%   Flag - set to 1 when OK button or Return pressed
edfield% Number of currently selected edit field
i%      General purpose loop counter
insize% Extent of input layer
j%      General purpose loop counter
menunumber% Number of item in menu selection
menunumber% Number of menu bar selection
number% Number returned by Dialog function of selected button or edit field
old%    Temporary variable for last value of neuron
outsized% Extent of output layer
pt%     Array - holds mouse position (y,x) as returned by GetMouse
recs%   Array - holds corner co-ordinates of input and output layers
s%      Sum of all weighted inputs to a neuron
side%   Returned by PtInRects - 1 if mouse is in input layer, 2 if in output
state%  Number of currently active radio button
x%      X co-ordinate of top left corner of current neuron
xin%    X co-ordinate of top left corner of input layer
xout%   X co-ordinate of top left corner of output layer
xpos%   Column number of current neuron
y%      Y co-ordinate of top left corner of current neuron
yin%    Y co-ordinate of top left corner of input layer
yout%   Y co-ordinate of top left corner of output layer
ypos%   Row number of current neuron
    
```

Neural Network Discriminator  
 © Jack Weber - November 1987

Constructs randomly connected neural network  
 "WISARD" type pattern discriminator  
 Single pass operation  
 Visual input/output

Runs on Apple Macintosh under MS Basic v3.0 with Toolbox Library

```

## FREEWAY SOFTWARE

BRITAIN'S LEADING SHAREWARE AUTHOR

### RAFE-II

(RANDOM ACCESS FILE EDITOR)

A utility program for people using BASICA, GWBASIC, MS-BASIC, QUICKBASIC etc...

Facilities include: display data records, edit data records, search the file for values in specified fields, header records, chained records. Also display ASCII files, print formatted program listings, etc....

Available for the following computers:-  
IBM PC & compatibles & Amstrad 1512 (£5.00)

IBM PS/2 - 3.5" disk (£7.50)

Registration & Full User Manual (£20.00)

All prices include P&P, VAT etc.

Send cheque with order to:

## List of Variables Used in Discriminator

a%	Array - holds values of all neurons in input layer
action%	Returned by Dialog function - shows type of last user action
b%	Array - holds list of input neurons for each discriminator unit
b1%	Array - holds values given by training examples in discriminator 1
b2%	Array - holds values given by training examples in discriminator 2
cell%	Number used to select random groups of input neurons
choice%	Choice of training or testing as selected by radio buttons
col%	Colour being painted - white = 30, black = 33
discriminator%	Number of current discriminator
done%	Flag - set to 1 when OK button or Return pressed
example1%	Number of current training example for discriminator 1
example2%	Number of current training example for discriminator 2
i%	General purpose loop counter
j%	General purpose loop counter
k%	General purpose loop counter
match1%	Flag - set to 1 if value of current group matches in discriminator 1
match2%	Flag - set to 1 if value of current group matches in discriminator 2
menuitem%	Number of item in menu selection
menunumber%	Number of menu bar selection
number%	Number returned by Dialog function of selected button
p%	Array - holds coefficients (1,2,4,8,16) for all neurons in group
plot%	Flag - set by PtInRect to -1 if pointer is inside input layer
pt%	Array - holds mouse position (y,x) as returned by GetMouse
rec%	Array - holds corner co-ordinates of input layer
s%	Value produced by pattern of five cells within a group
score1%	Score (number of matched patterns) for discriminator 1
score2%	Score (number of matched patterns) for discriminator 2
state%	Number of currently active radio button
x%	X co-ordinate of top left corner of current neuron
xpos%	Column number of current neuron
y%	Y co-ordinate of top left corner of current neuron
ypos%	Row number of current neuron

END

or an SAE for a full description of the  
PC-Bridge program

# In 21 years **Dateline** introductions have been the start of many, many thousands of Love Stories...

Some of these 'Love Stories' you will have read in our advertisements, but a new book, 'All You Need is Love', published by Sphere, fully illustrates Dateline's role as a modern matchmaker through many more true stories of people who were looking for someone special to share their lives, and were happily, amusingly surprisingly matched by Dateline.

Many tens of thousands of people of all ages and occupations, from all over the country, join Dateline every year looking for someone to love. They want to meet someone with the same hopes, ambitions and interests as themselves, and are simply not meeting them socially or at work. Dateline opens up a whole new world of compatible people; people who could be living very close to you, but who, without Dateline, you might never meet.

### 'Are you being serious?'

Was Lorraine's answer to Gary when he went down on one knee to propose in the middle of a nightclub. It was only three weeks after their first meeting, but she did say 'yes!' Oddly enough Gary had been a member of Dateline almost a year when Lorraine's name appeared on his list, but his name had been given to her six months before, and she hadn't bothered to contact him as quite a number of young men were already phoning her. Very little time elapsed before they found they were compatible and happy together, and a year after that impulsive proposal, they were married.

# You <sup>too</sup> can find love

\* A Sphere paperback available from newsagents and bookshops at £2.50.

**FREE BOOK!**

## All You Need Is Love

- When you join Dateline you choose the sort of person you wish to meet and the area they should come from, and as the largest and most successful dating agency in the world, Dateline has the membership to provide that special person you are looking for.
- Joining Dateline is simple and inexpensive; we guarantee our service. We are the most experienced, reliable and professional dating agency, and we care that your membership is successful, so you are welcome to phone us at any time; or simply call in and see us.

If you would like to know more about how Dateline could find love for you, and also receive your FREE copy of 'All You Need is Love', complete this coupon today and post it to: Dateline, 23 Abingdon Rd., London W8 6AH. Tel: 01 938 1011

I am seriously interested in learning more about Dateline and how you can help me find my perfect partner...

Please send me FREE and without obligation

- My free copy of 'All You Need is Love' (while stocks last)
- The results of my 'Free Computer Test', giving details of just one of the Dateline members who are compatible with me.
- I am over seventeen and not already a member of Dateline.

I enclose 3 first class stamps to cover post and packing

### FREE COMPUTER TEST to Find Your Ideal Partner.

- **Wanted Amstrad 1512 Basic Model.** Or Atari 520ST, high res mono monitor, disk drive. Tel. (0223) 62129 Cambridge, Mr Ross.

## LEISURE LINES

### Quickie

No answers, no prizes for this one.

What number must be added to both the numerator and the denominator (top and bottom) of the fraction  $\frac{2}{5}$  to give a result of  $\frac{3}{4}$ ?

### Prize puzzle

The sequence of numbers 1,1,2,3,5,8,13,21,34 is known as a 'Fibonacci' series, since each number in the series after the first two is formed by adding

the preceding two. Thus,

$$2=1+1$$

$$3=1+2$$

$$5=2+3$$

$$8=3+5$$

and so on.

In our example we started with 1 and 1, but we could have started with any two numbers.

If we wanted to include the value of one million — that is, 1,000,000 — in our series, what are the two smallest positive (non-zero) numbers that we

could have used to start off the series? We define the smallest two numbers as the two numbers whose sum is the least. (Note that the second number cannot be less than the first, although it may be equal.)

Answers on postcards only please, to arrive not later than 31 March 1988.

Send your entry to: Leisure Lines Prize Puzzle — March, *Personal Computer World*, VNU House, 32-34 Broadwick Street, London W1A 2HG.

### December prize puzzle

This was much harder than usual. Only 31 entries were received, of which eight were incorrect.

The winning card, drawn at random, came from Mr Martin Fisher of Thornbury, Avon.

The winning solution is:  
 $96 \times 8745231 = 839542176$   
 Congratulations Mr Fisher, your prize is on its way. To all the others — keep trying.

## DIARY DATA

A guide to forthcoming computer shows. Readers are advised to check details before setting out on their journey.

<b>ELECTRON &amp; BBC MICRO USER SHOW</b> UMIST, Manchester — Database Exhibitions (061) 456 2991	18–20 March 1988

<b>ATARI COMPUTER SHOW</b> Alexandra Palace, London — Database Exhibitions (061) 456 2991	22–24 April 1988

## NUMBERS COUNT

Mike Mudge returns to the popular topic of prime numbers including reference to recently published results.

**Definition** Denote by  $p(n)$  the number of prime numbers not exceeding  $n$ . Thus  $p(1) = 0$ ,  $( )$ ;  $p(10) = 4$ , (2,3,5,7);  $p(100) = 25$ , (2,3,5,7, ... 79,83,89,97).

### The state of the art

EDF Meissel (*Math Ann* 1870, vol 2, pp636–642; 1871, vol 3, p525; 1885, vol 25, pp251–257) calculated and published  $p(10) = 664579$ ,  $p(10^8) = 5761455$  and  $p(10^9) \dots$  which remained the largest published result until 1959. In that year DH Lehmer (*Illinois Journal of Math* vol 3, pp381–388) corrected  $p(10^9)$  (the value calculated — by hand — by Meissel being too small by 56) and published  $p(10^{10})$  (in fact, too large by 1).

In 1986 P Shiu (*Math Comp* vol 47, pp351–360) published  $p(10^{11})$  and  $p(10^{12})$  while JC Lagarias, VS Miller and AM Odlyzko (*Math Comp* vol 44, pp537–560) calculated  $p(4 \times 10^{16})$  using approximately 30 hours processing time on an IBM 3081 Model K.

It is clear, therefore, that PCW readers should not feel encouraged to extend the range of values of  $p(n)$  beyond  $4 \times 10^{16}$ .

### Problem

The computing problem associated with  $p(n)$  which follows is formulated in such a way that it tests the skill and ingenuity of the programmer rather than the speed and word length of the computer, the efficiency of the compiler or

the choice of language.

How many basic operations do you need to compute  $p(n)$  for a given  $n$ ? In particular, for  $n = 10, 100, 1000, 10000$ . Note It is recommended that an algorithm is detailed, coded and checked, then an operation count carried out. If possible, the fundamental operations of arithmetic should be separated into + - \* & / and, in turn, separated from logical operations. It is thought inadvisable to attempt this count from the algorithm at its pencil and paper stage. Readers may feel differently! If such a count seems too laborious, an alternative measure of efficiency may be supplied in the form of ratios of times taken to evaluate  $p(10^n)$ :times taken to evaluate  $p(10^{n-1})$  as a function of  $n$ .

As and when multi-precision arithmetic becomes essential, many readers will feel that they are excluded from entry ... but rest assured an efficient algorithm developed within the normal arithmetic preci-

sion of the computer is likely to remain efficient when combined with suitable arithmetic multi-precision routines which may not be immediately available.

Changing the subject: **A Nearly Pattern involving Palindromic Squares**  
 In February 1985 a study of palindromic numbers (read-

squares appearing on the right-hand side. It is nearly, but not quite, palindromic! Why?

Readers are invited to send their attempts at eight-ter, or both, of the above problems to Mike Mudge, 'Square Acre', Stourbridge Road, Penn, South Staffordshire WV4 5NF, to arrive by 1 June 1988.

It would be appreciated if such submissions contained a brief summary of results obtained, in a form suitable for publication in PCW. These submissions will be judged using subjective criteria, and a prize will be awarded by PCW to the 'best' contribution received by the closing date.

Please note that submissions can only be returned if a stamped addressed envelope is provided.

ing the same way backwards and forwards) produced the record ever response to a 'Numbers Count' article. Thus it seemed appropriate to quote the result (see Fig 1) of JKR Barnett (*Bulletin IMA*, vol 23, Nos 6/7, June/July 1987 pp100–101).

Now construct the eighth member of the sequence of

Mike Mudge welcomes correspondence on any subject within the areas of number theory and other computational mathematics. Particularly welcome are suggestions, either general or specific, for future Numbers Count articles; all letters will be answered in due course.

Isolated readers can be put in contact with others sharing the same interests. However, greater efficiency regarding published problems should result from contacting the prizewinner.

Rupert Steele presents his regular round-up of UK user groups.

The personal computer business is a very different game from what it was at the beginning of the 80s. The success of IBM has forced us into a number of hardware and software standards which have proved remarkably enduring, no doubt because there are very few things that *homo sapiens* likes less than learning how to drive a new word processor.

While good for users who see computers as black boxes for getting things done, this standardisation has been mixed news for user groups and for innovation towards better standards. Many user groups now have PC sections of varying quality which supplement the information widely available from specialist magazines, but the number of new machines which are significantly different from the PC standard is quite small. Consequently, many user groups now support machines which have been discontinued.

This is, of course, an extremely valuable service, although not usually one that can go on for ever as, eventually, many of the systems in circulation end up on the scrap heap. However, until a discontinued model reaches this 'dead' state, it would be better to call it 'retired' and be thankful for the dedicated enthusiasts who run the user groups for such machines.

There are, of course, exceptions. For example, the UK user groups for Commodore and Apple (ICPUG and Apple2000 — see the 'Directory') support the whole family of products, from the retired Pet and Apple II through to the active Amiga and Macintosh.

## Ethics

One interesting retired machine is the Texas Instruments TI99/4a, which is being supported in its old age by no less than two competing groups: Clive Scally, the chairman of TI99/4a Users Group UK, has written to me about the services this non-profit group provides. There are some 500 members, a free public domain software library, and a regular 60-page newsletter called *TI \*MES*.

Clive has also asked me to clarify publicly why his competitor, The International TI User Group, is also included in the directory, as it is run by proprietors as a small business. The answer is quite simple. The 'User Groups' column and the accompanying directory exist to provide readers

with contacts that may lead to solutions to their computing problems. It is not for me to make judgements as to whether it is right for the people who provide solutions to earn all or part of their living from doing so.

I will obviously say if the services on offer appear to me to be bad value — and have done so on occasion. And while I cannot guarantee the type of service given by any of the groups listed in the directory, I will remove those who

actually printed on A4 paper but, unlike most of the others, it aims as much to entertain as to inform). It is for Amstrad CPC users, with a little bit of the PCW and PC machines thrown in, and is scruffily produced, rather rude, and relentlessly good fun. Strongly recommended for those who don't take their computing too seriously. Contact Jeff Walker, 75 Greatfields Drive, Hillingdon, Uxbridge UB8 3QN.

The latest newsletter from the Amstrad 1512 Independent

Lakenheath, Suffolk, tel: Eriswell 2363.

From further west I have had a copy of the newsletter of the Reading Computer User Group, which meets at 7.30pm on the first and third Thursday of each month in the senior common room of Reading University. The subscription rate is £5 a year, and this includes a quarterly newsletter. The issue I saw was a little sparse, although it did have an excellent article on the 'fuzzy' matching of misspelt names using the Soundex code. Contact Mike Mallett, RUG News, 19 Knollmead, Calcot, Reading RG3 7DQ.

I have had a letter from Paul Cuthbertson about the Grampian Amateur Computer Society. The club places great emphasis on the technical aspects of computing, and the more 'serious' applications as opposed to simply playing games. The members, coming from all walks of life, meet regularly on Monday evenings and the club aims to provide organised talks, demonstrations and visits wherever possible. There is a newsletter every two months which gives details of forthcoming events as well as some interesting hardware/machine code information. Those living in the north-east of Scotland might like to call Paul on (0467) 24030 or write to him at 18 Morningside Crescent, Blackhall, Inverurie AB5 9FA.

Finally, the Lincolnshire Micro Society has sent me a sample newsletter. This has been simply produced, and contains some technical material as well as club news and the programme of meetings for this Spring. The club will meet at the Cardinal's Hat, Grantham Street, Lincoln at 7.30pm on: 16 March (Amiga Music), 6 April (PCs), 20 April (Amateur Radio & Computers), 1 & 15 June and 6 & 20 July (to be arranged). There are also meetings at other locations on: 22 March (the Night Sky), 11 April (Desktop Publishing) and 10 April (Interactive Video Disks). For details of this busy group's activities, call Douglas Griffiths on Lincoln 680578 or write to him at 659 Newark Road, Swallowbeck, Lincoln LN6 8SA.

If you would like your user group or club be mentioned in this column, or you wish to be considered for the Directory of User Groups, please write to Rupert Steele, 12 Philbeach Gardens, London, SW5 9DY, or tel: (01) 370 0601.

appear to be the subject of continuing legitimate complaint. I hope that answers your question, Clive.

Membership enquiries for Clive's group should include an sae and be sent to Peter Walker, 24 Bacons Drive, Cuffley, Potters Bar, Herts EN6 4DU.

Having mentioned the rather expensive 'World of Lotus' running on Telecom Gold a few months ago, I should touch on the Ashton-Tate equivalent, also on Gold. This is called 'Serviceline', and is described as 'a further development in Ashton-Tate's commitment to increasing its level of customer support'. It will be regularly updated and includes news, product information, a user notice board, Tech-Tips and other features. The press release is not absolutely clear as to what charges, if any, are made for the service, so the next step should be to write to Clare Winter, Ashton-Tate UK, Oaklands, 1 Bath Road, Maidenhead, Berks, or tel: (0628) 33123.

## In the news

I have been sent a couple of sample newsletters from Amstrad clubs. One is *WACCI*, the only 'tabloid' computer club newsletter I know of (it's

User Group is quite a different animal, aimed at the serious PC1512 and PC1640 user and packed with a lot of useful information that would, indeed, be helpful to users of other types of PCs. It contains 120 A5 pages of closely-printed information, including a 12-page piece on the innards of MS-DOS, all sorts of reviews, and lots of technical information. A good one. Call (0732) 63157 for more information.

## Local clubs

Although there has been something of a thinning out of local computer clubs recently, some of the more effective ones are still going strong — indeed, some are growing. I have had a note from Martin Randall, of the Gateway Computer Club, pointing out that they have some 150 members. The group meets at the Bob Hope Recreation Centre at RAF Mildenhall on the third Sunday of each month from 2pm to 4pm. There are specialist sections for a variety of topics including the Mac, the Commodore machines and PCs. There is also a monthly club newsletter (about 20 pages) included in the membership fee of £7 a year. For more information, contact Phil Herberer, 164d Radcliffe Road,

E N D Z O N E

## Basic gone bust

I am having difficulty loading GW-Basic on my Amstrad 1640 HD ECD. Although it initially seemed to load correctly from the hard disk, all I got on the screen was a flashing cursor at the top and the machine needed resetting.

Thinking it might be a problem with the hard disk, I tried booting and loading Basic from the floppy disk; that seemed to work for a while but then that too stopped. This was after I first loaded PC Deskmates.

*Chris Elliott, Brockenhurst, Hants*

There are a number of things to check. The most obvious is making a fresh copy of GW-Basic from your distribution disk — it could be that the copy you are running has been corrupted. If you have not made copies before and have been using the original disk, then you are about to learn a new lesson — *never* use the original disks. Always (copy protection schemes permitting) work from copies.

Another solution may lie in PC Deskmate. As you are running the EGA version of the Amstrad PC, it could be that this resident software is interfering with the way that GW-Basic writes to the screen. A single flashing cursor on a blank screen is symptomatic of a situation where the program you are running is writing to a different screen device than the one installed.

As an experiment, load GW-Basic, and when you have your blank screen, just type the word SYSTEM followed by a carriage return. If GW-Basic is in fact writing to the wrong screen address but still running satisfactorily, it should still read the keyboard and act on what it receives. In this case, the computer should exit GW-Basic and return you to DOS, with your usual DOS prompt appearing on the screen.

Check that your CONFIG.SYS and AUTOEXEC.BAT files don't contain any mode commands to affect screen behaviour.

## WordStar times out

I have just changed from Superwriter to WordStar Professional Release 4, but have kept my Juki 6100 printer. My problem is that printing has now become extremely unreliable.

I bought the Juki in 1984 and the manual is rather out of date. It advises me to install the printer within WordStar as a Diablo 630 and to include the statement 'mode lpt1:..p' in AUTOEXEC.BAT. When I tried this, the result was pretty horrendous. I achieved a marked improvement by installing the printer as a Diablo daisywheel, but this has not solved the problem entirely.

During printing, the printer stops, apparently randomly. If I am lucky, pressing 'C' restarts the printing correctly but, all too often, the Juki goes haywire, writing garbage or reprinting a section of text from earlier in the document.

Can you help?  
*RG Knight, Hendon, London*

Solving the timing-out problem is not difficult. Run the program called WSCHANGE that is included with WordStar and increase the printer time-out variable. Using a lengthy document as a test, gradually increase the value until the whole document prints without problems.

I can't explain why the printer goes haywire after pressing 'C' to continue, as no special control codes are sent during a time-out. My only suggestion is that sometime during your experimentation, you've corrupted the printer driver. Try using a fresh copy of the WordStar software.

For the best results, drop the mode statement from your AUTOEXEC.BAT and create your own printer driver using the generic Diablo daisywheel as your model. Using the Juki manual and the WordStar manual, this is a fairly easy task. (By the way, these solutions were found with relative ease in the *WordStar Professional* manual.)

## Long-distance reading

I have an NEC computer with a Z80-compatible CPU and 64k of memory. I know very little about CP/M and wonder if you could recommend any books on the subject.

*Khalid Al Zubaidi, Baghdad, Iraq*

At such a distance it is difficult to advise you on what might be available in your country. In the UK there are two sources of information. Firstly, you should write to the PIP User Group whose address appears

in the 'User Groups' directory on page 215. The other option is to write to Computer Bookshops at 30 Lincoln Road, Olton, Birmingham B27 6PA, whose catalogue will include some CP/M-specific books. (Make sure you turn to this month's 'Bibliofile' also to read our review of *The CP/M Plus Handbook* on page 165. Ed.)

## The main attraction

My faithful BBC Micro will have to go. I can't bear its lack of memory any longer, and I can't afford an Archimedes. I have decided on a PC compatible, probably Amstrad, but how easy is it to emulate the BBC's teletext screen mode?

*Graham Crowder, Edinburgh*

Mode 7 on the BBC Micro is one of that machine's great attractions. It uses very little memory and provides a display mode compatible with viewdata systems like Prestel, which I assume is what you want the teletext mode for.

Unfortunately, PCs are very bad at teletext. The teletext character set comprises seven colours, numerous graphics characters and the option to have any character double-height and/or flashing. The poor PC is stuck with a text character set of 256 characters with totally different graphics characters and only flashing as an attribute.

To emulate the teletext character set, there are two solutions. One method is that followed by Sagesoft with its ChipChat communications package. This approximates the teletext system, but the graphics are only approximate and double-height characters are replaced by single but underlined ones. It also offers a replacement character set ROM for full teletext, but this loses you some of the IBM characters, such as rules and European characters, which you may want.

The alternative is to drive the PC in graphics mode. Again, the PC is poor here compared with the BBC. In its cheapest CGA mode, it can only manage three foreground colours (red/yellow/green or cyan/magenta/white) and drawing teletext screens in graphics mode is slow. EGA graphics can provide the full teletext emulation but is also slow, and the hardware required is quite expensive. Many other communications

Computer Answers is PCW's help column. We offer advice about all kinds of hardware and software problems through the pages of the magazine. The address to write to is: Computer Answers, PCW, VNU House, 32-34 Broadwick Street, London W1A 2HG.

programs such as Baudwalk, Datatalk and Vicom-GemComm use this option, and you get all the correct attributes and graphics, but you're limited in the number of colours you can see.

Smartcom III from Hayes works best with an EGA, where it re-programs the EGA board's own character set and so produces a full teletext emulation but with the speed of a text-mode screen.

The best teletext terminal you can find is almost certainly your BBC. Why not keep it as a dedicated terminal and use your PC for everything else?

## ANSWERING BACK

Would you like to contribute to PCW's 'Computer Answers' page and earn yourself £25? If you've tackled a technical problem recently and think the problem and its solution might benefit other readers, send it in. We'll publish a selection of the letters received each month, with the most useful or innovative solution earning its author £25.

Keep your letters brief — no more than 250 words in total. Feel free to include short listings (maximum 20 lines) or simple diagrams, and make sure that you include enough details for other readers to implement what you describe.

We're still interested in receiving your intractable problems to test the skills of our panel of PCW experts, so keep on sending in those puzzles.

All submissions should be sent to: Computer Answers, PCW, VNU House, 32-34 Broadwick Street, London W1A 2HG.

## Apricot — THING OF THE PAST?

Not for us...

We are still operating a full service for users of "generic" Apricots. We produce new software, and continue to support the old. 100,000 Apricot customers can't be wrong! If you are one of them, make the most of your **PC, Xi, Xen, F2, F10 or Portable**. Ask for our information sheet and discover why we have never been busier.

Here are a few clues:

<b>ACOLYTE</b>	A suite of memory resident utilities, key configuration, printer problem-solver, etc.
<b>LOG</b>	Appointments database.
<b>ASD</b>	Ansible SuperWriter Disk: the complete Apricot accessory disk.
<b>WORDPERFECT</b>	We supply the latest Apricot version, discounted, supported.
<b>PARAGON</b>	Our own WordPerfect utilities... exclusive!
<b>MAILER</b>	Converts your word processor into an address and labelling database.
<b>PUBLIC DOMAIN</b>	We offer a full library of software — games, rare utilities, arcane documents files — and charge only for copying.

And if you're yielding to the inevitable and have recently bought an IBM clone... our latest package is **APE**, the Ansible Apricot Emulator! This runs most Apricot software: the 'Super' pack, Turbo Pascal, dBase II, Wordstar, etc.

We publish a regular information news-sheet for Apricot users, plus much more! Full details in our brochure and price list.

# CAUTION! THESE DISKS ARE HOT!!

... Two white hot packages from Macropac which immediately increase the efficiency and speed of every type of Lotus 1.2.3 and Symphony user - from total novice to complete expert.

Each disk contains 101 macros - tips and shortcuts which are almost magical in the time they save - that allow you to

- Add word processing facilities including word-wrap
- Set up and maintain data bases with one command
- Create special graphics and slide shows
- Add a 'pop up' note pad, calculator and appointment calendar
- Add menu-driven formulas and maths functions

AND 95 other indispensable short cuts, utilities and keystroke savers to multiply the power of your spreadsheet. In fact, as PC Magazine put it 'You should buy this. Hot stuff'. FREE BONUS - 22 FREE files and extra useful tips included for limited period only.

## ORDER TODAY - 30 DAY MONEY BACK GUARANTEE

EACH ONLY £39.95 + VAT

Please send me: 101 Macros for Lotus 1.2.3  101 Macros for Symphony

I enclose a cheque made out to Macropac International for £45.94 to cover the cost of disk, instruction manual, VAT and P & P  Please invoice my company

## BABY - 386 MAIN BOARD

- 32 bit CPU-386
- Dual speed-8MHz or 16MHz (20MHz, 25MHz), switchable by keyboard.
- 32 bit memory configurations: 2M, 4M, 8M, 10M, 16M.
- Relocation of system BIOS and EGA BIOS to 32 bit RAM.
- On board rechargeable battery for Real Timer Clock.
- 8 I/O slots - 2 eight slots, 4 sixteen bit slots, 2 thirty two bit slots
- Sockets for 80287 and 80387 Math Coprocessor.
- Three Programmable Timer.
- Seven DMA Channels
- Sixteen Interrupts
- Selectable DMS Clock.
- Fits in XT, baby AT and AT case.

## BABY - 286 MAIN BOARD

- Intel 80286 CPU-10MHz/12MHz Dual speed-6 MHz or 12MHz (8MHz or 16MHz), Keyboard and Hardware switchable.
- 4MB memory (1MB DRAM)/1MB memory (41256 DRAM) switchable
- Base memory-640KB and 512KB switch.
- Real-Time clock with built in rechargeable battery.
- Lotus/Intel EMS compatible.

## BABY AT MAIN BOARD

- 80286 CPU-10MHz/12MHz
- Speed by 6/8/10/12MHz
- 1MB capacity (640K/384K) or capacity (512K/512K) configuration
- Real-Time clock with built in rechargeable battery.
- Lotus/Intel EMS compatible.
- Serial, 2 parallel ports built in. 4MB DRAM on board.

## NEW PRESENTATION FROM FULLINK:

Introducing three innovative new products to make your computer more functional as well as more streamlined. Our products give you new options in computing, opening up limitless possibilities.

### I. 3 IN 1 MAIN BOARD MAIN BOARD + MULTI I/O + DISPLAY

- CPU and memory control system
  - a. 8088-1 CPU
  - b. M1101 gate array
  - c. 4.77/10 MHz speed (switchable)
  - d. RAM: expandable to 640K Byte
  - e. ROM: 8KB for BIOS, 32KB for user
  - f. 8087 coprocessor option
  - g. Key lock

FK-1001

- Hercules/MGA or color display port.
- Two RS232 serial port. (COM2 option)
- One printer port. Game port.
- Light pen port. Real time clock.
- Floppy driver adaptor on board.

### II. VOICE MODEM CARD

- Hayes SmartModem command compatible
- Voice Port. Compatible with CCITT V.21/V.22 and bell 103/212A
- Full or half duplex 300/1200 bps  
(One smart telephone answer machine program will be given for free)

VM-102

And by using simple basic program on our card, you can also develop other powerful & marvelous functions, such as:

- Telephone reservation
- Telephone operator
- Vocal security guard system
- Remote control system

### III. LOGITERMINAL

- 12 programmable function keys
- Emulation ADM3A, TVI 925, VT100 ANSI selected by DIP switch
- PC/AT Terminal compatible

We bring new dimensions to the conventional terminal: with your PC keyboard and PC monochrome monitor, our products work wonders.

## RELATIONAL DATABASE

# How to write your own software without the help of a programmer.

TAS Plus just made it faster, easier and cheaper to build database applications. It is a tool for anyone that wants to enter, store, display, report and manipulate information quickly and easily. TAS Plus combines the power of a relational database with the ease of a screen painter and a program generator. Then TAS Plus adds a runtime compiler that produces lightning fast code that outperforms all databases we know of. For just £99 look at what TAS Plus gives you:—

- **Relational Database**
- **Screen Painter**
- **Program Generator**
- **Report Generator**
- **Database Browser**
- **Source Code Editor**
- **4th Generation Language**
- **Runtime Compiler**
- **350 Page Tutorial and Reference Manual**

### TAS Plus, for both Novice and Professional Programmer

TAS is fast and easy to learn. The excellent 350-page tutorial and reference manual will teach you how to develop your first application on day 1 and create new programs in as little as 20 minutes. Even if you have never programmed before.

Just "paint" the screen the way you want and the Program Generator writes the program for you. Custom reports are just as easy. When you have created your first database applications, the database browser and report generator allow you to retrieve the information quickly and print it to screen for a quick preview, direct to the printer, or to disk for subsequent word processing.

#### TAS Plus Technical Features:

##### (Developers version in brackets)

- TAS programs compile down to intermediate machine code for superfast loading and execution. TAS itself is written in Assembler for optimum efficiency.
- TAS uses high-speed B-Tree file access with built-in multi-company filing system. It handles 16 (32) simultaneous open files and each file can be accessed using up to 16 (32) keys.
- TAS has excellent array handling and string manipulation. Max. field size is 254 characters and max. number of array elements is 255.
- It supports 10,000 fields per record up to a max. record size of 10,000 characters.
- Each file may have up to 65,000 (17 million) records.
- A central data dictionary holds all data file structures in one place.
- All reports may at runtime be forced or selectively printed to screen (for a quick preview), to disk (for WP) or to the printer.
- Read and write 1 (3) ASCII files with fixed or variable length records and quote/comma delimited format (WordStar MailMerge).
- Automatically convert dBase III to TAS and TAS to dBase III data files.
- File types are alphanumeric, numeric, time and short/long European/US date and any field can be an array field.

- 4th Generation procedural language provides an incredible, but easy to learn, 85+ commands including IF, DO, WHILE, FOR/NEXT, GOTO, GOSUB, ON etc. with more than 200 options.
- Up to 9 (32 for Developer) individual screens and report formats per program.
- Full arithmetic including time and date arithmetic is supported (add and subtract times or dates and get the results in minutes or days)
- Numeric fields are stored in BCD format which saves space. Numbers may be up to 20 digits with up to 8 decimal places.
- Powerful TRAP command "traps" all function keys, numeric keypad and file Input/Output.
- From within TAS you can run other TAS programs, run non-TAS program and execute DOS commands.
- Even from within programs you can initialize, rename, restructure and delete files and calculate file sizes.
- Totally automated "idiot-proof" syntax-checking source code editor. Create your own pull-down menus and up to 10 overlapping windows.
- Up to 128 colour combinations, all IBM graphics, video highlight/normal/reverse and powerful scroll and wrap commands.
- User definable print control characters, full function key access and control.
- TAS Plus is supplied on 2 (3) floppy disks as a license to use on a single machine. It is not copy protected.

"If you can not find a commercial package to suit your organisation, then most certainly this must be one of the first places to start looking in order to produce a system of your own"

writes Jo Stork in the June 87 issue of Personal Computing with the Amstrad and produced "an impressively looking, well tested system using 5 files and requiring 20 programs inside 12 hours". (Reprints available on request)

### Stop Evaluating!

dBase III	£595
Dataflex	£575
DataEase	£545
Delta4	£545
Paradox 2	£595
RBase V	£545
<b>TAS Plus</b>	<b>£99</b>

Step-by-step you will learn how to use the totally automated, syntax checking source code editor which even tells you on which page in the manual to get more help. And expand your programs to support multiple files and screens and add the "professional" features such as your own pull-down menus and TAS windows to make your software look like it would have cost thousands to develop. (We're the only database that can do this.)

TAS Plus can display 128 colour combinations and all IBM graphic characters. Your programs can have extensive calculations and even get at or set the system time and date. TAS Plus will show you how to produce programs that are better looking with on-line help and more user-friendly features than even the very expensive "professional" software.

And finally, when it comes down to the speed of writing and more importantly, running your applications (because that's what you do every day) you will find that the compiled code makes it load, read and write data quicker than any other database. And if you already have dBase III, TAS Plus can read and write those files as well. Now, you must agree that's respectable at any price. At £99 it's a must!

### TAS Plus Developer's Version includes utility source code.

TAS Plus at £99 is suitable for almost everyone. The Developer's Version at £199 is for those that program professionally. (An upgrade pack is available for £135.) It has additional features and commands for developing applications which may be quite enormous in size. In addition to the TAS Source Code Editor, programs can also be created and maintained using an ASCII editor like NewWord or WordStar.

And note that all TAS utilities are written in TAS Developer's Version. **No other database or procedural language is only remotely capable of this.**

**And the source code is included.** This source code will show you how to write a program generator or a report generator, what techniques are used in the screen painter and the database browser etc.

### Multi-User Developer's Version:

This costs £349 and supports file/record locking and runs on all MS-Net/DOS 3.x compatible networks incl. Token Ring, PC-Net, Novell, DNA, Northstar etc.

### System Requirements:

TAS Plus and TAS Plus Developers Version run on any IBM PC, XT, AT or PS/2 compatible computer system including the AMSTRAD 1512 and 1640. TAS needs 512KB RAM and at least two floppy disk drives but we recommend a hard disk for development. Run-time applications will run excellent on single floppy systems.

Send for more information. Order from your local dealer. If in difficulty phone us on 01-874 6511 with Access or VISA card information or send cheque for £115 (incl. £1.00 towards P&P & VAT) payable to **MEGATECH** at the address below for 1st Class same-day despatch.

— 2Mb of EMS Memory	280.00	360.00
RAM 4000 — PS/2		
— 4Mb of EMS Memory	370.00	550.00

## EVEREX TURBO CARD

Replaces PC/XT 8088 with the 80286 Microprocessor and Fills out Base memory to 640Kb.

Excelsior	OUR PRICE	RRP
— Replaces 8088 with 80286 Chip	359.00	499.00

## EVEREX GRAPHICS CARDS

Evergraphics Deluxe	OUR PRICE	RRP
— High Res. Mono Card & Hercules Compatible.	140.00	176.00
Everex Edge		
— Dual Mono & Colour Card	270.00	369.00
Micro Enhancer Deluxe		
— EGA Card	179.00	206.00
PGA		
— Professional Graphics Adapter	999.00	1375.00

## EVEREX MULTIFUNCTION CARD

Powerful Multifunction Cards which have Parallel Printer Port, one Serial Port as standard and an optional Second and Games Port.

Magic I/O	OUR PRICE	RRP
— Multifunction & Clock Calendar Magic Card II	80.00	95.00
— Multifunction, 576Kb of Memory & Clock/Calendar	195.00	240.00
Multifunction EMS		
— Multifunction with 1Mb of EMS Memory & Clock/Calendar	175.00	220.00
Magic Card 16 (For the AT)		
— Multifunction with 2Mb Memory	195.00	235.00

## HARD DISK DRIVES

Package includes Drive, Cables, Fitting Kit, Formatting Instructions Partitioning Software. All disk products are Genuine Seagate/Miniscribe drive with Western Digital Controllers.

Miniscribe 20Mb 3425 drive with controller	OUR PRICE	RRP
	195.00	

Miniscribe 40Mb 3650 drive with controller	OUR PRICE	RRP
Seagate 20Mb ST225 drive with controller	230.00	
Seagate 30Mb ST238 drive with controller	260.00	
Seagate 40Mb ST251 drive only	330.00	
Seagate 80Mb ST4096 drive only	950.00	
20Mb External hard disk with controller	340.00	
20Mb hard card	250.00	
30Mb hard card	280.00	

## CHIPS AND COPROCESSORS

DRAM 64k (150ns)	OUR PRICE	RRP
DRAM 256k (150ns)	1.50	3.30
DRAM 256k (120ns)	3.50	
Maths Co-Processor 8087	130.00	
Maths Co-Processor 80287-6MHz	170.00	

## SPECIAL OFFERS

360Kb Floppy Disk Drive	OUR PRICE	RRP
1.2Mb Floppy Disk Drive	105.00	125.00
Serial Port Card	39.00	
Parallel Port Card	39.00	
8 Port Serial Card & Cables	195.00	
Speeds up applications such as Databases, Wordprocessors, CAD-CAM etc. Up to 3 times faster and will also lower hard disk head wear.		
Turbotech software	OUR PRICE	99.00

## EVEREX MONITORS

14" Flat tube/Anti glare dark glass/tilt & swivel	OUR PRICE	RRP
Mono monitor	133.00	170.00
EGA monitor	359.00	423.00

## GRAPHICS KITS

Mono kit	OUR PRICE	RRP
Evergraphics deluxe + Mono monitor	260.00	399.00
EGA kit		
Micro enhancer deluxe + EGA mon	499.00	599.00

# Learn C this week!

C programmers can earn £15k or more — you could become one of them for just £29.95!

Living C Personal is the best possible way of breaking into the riches of C programming. It is a full learning tool with a powerful friendly editor and a lightning fast interpreter that actually shows you what your program is doing! The animator will move the cursor through your program, from word to word, showing the exact path taken. Line by line tracing can only show you what line it got to — little more than TRON and TROFF in Basic. Living C shows you which code was executed *precisely*. At the same time, you can see the output of your program on the screen, together with variables and even a backtrace of all your function calls. With Living C Personal you could break into the big time. You deserve the best, Living C Personal is the best, so order now — we will ship the same day!

The pull down menu system is easy to use with help on any option available with a single key

The output from your program appears in a scrolling window. No crudly flipping between screens to see relevant results.

Because you're just starting, you'll need lots of help. We give you real help on errors, functions and even C itself.

The difference between Living C and other inferior C products is the ability to truly 'animate' the code. The cursor moves from word to word, tracing the exact path of execution. No other product can offer this level of information.

C is an immensely powerful language but it has drawbacks. Certain sorts of bug are nearly impossible to find — even for seasoned professionals. No current compiler product can trap uninitialised pointers. One bad pointer can wipe your hard disk! Living C finds them with ease because it is an interpreter — it puts you in full control. You can interrupt at any time to look at variables — displayed in a form you can understand.

Living C can track your calls dynamically as they happen. It can track the values of variables as they change. Think how that clarifies your programming!

## Convert Basic to C

If you already have some programs written in BASIC, you can convert them to C with our B->C compiler. It converts non-graphic BASIC commands into fully portable C. You don't need to throw away your investment. It may even give you a leg-up into C programming as you can compare the C with your original BASIC. Independent reviewers have said that B->C is the best conversion product they have seen. At £29.95 it's a steal!

Living C Personal £29.95 + £2 p&p + VAT

B->C £29.95 + £2 p&p + VAT

Special offer the two for £49.95 + £4 p&p + VAT

"Deserves to be up there with Turbo Pascal and the other software bargains of the decade" Byte.

"Living Software have not missed a trick in coming up with a product stuffed full of good ideas, all of which are smoothly implemented. Certainly, in use the product is overwhelmingly impressive — probably the most impressive system software product I have seen this year" PC Week

LIVING SOFTWARE  
34, Bramble Avenue  
Conniburrow, Milton Keynes

Break free from the constraints of  
BASIC  
and become one of the elite!

# Seven sure ways to increase your profits

**1** Your profits increase by 3% when you make your customers pay 20% faster. You can do this with smart, accurate Statements, and by prompt and efficient Credit Control.

**2** Your profits increase by 5% when you decrease your stocks by 22%, and by an extra 3% when you never disappoint your customers by being out of stock. You can do this when you have an efficient stock control system.

**3** Your profits increase by 1% when you can persuade your Bank Manager to give you a lower interest rate. You can do this when you have comprehensive figures to support your business plans.

**4** Your profits increase by 2% when you can pay your suppliers 20% slower (but without having your supplies stopped!) You can do this when you have full Purchase Ledger information.

**5** Your after-tax profits increase by a massive 21% when you halve your tax bill. You can only attempt this when you start financial planning early, with full information available in an easily understood form.

**6** Your profits increase by 2% when you more than halve your accountant's fees. This is easy when your accounts are already complete and accurate.

**7** Your profits increase by 10% when your time is spent on real work, rather than paperwork.

■ These are ALL actual estimates from customers.

■ Works on all IBM-PC compatibles and networks.

■ Prove to yourself that our software is the easiest, most complete, and most reliable on the market. For only £19.95 you get, not a demo, not a cut-down version, but the complete system to try for 3 months. And even if you do not then stay with us, you will have learned all you ever need to know about keeping your accounts on computer.

Only

**£19**

.95  
3-month trial

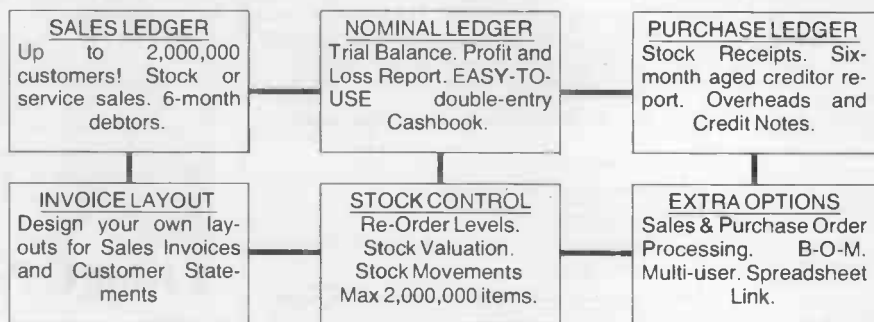

## SimpAcct

**COMPLETE.** All you will ever need for your Accounts, Stock Control, Invoicing, and Sales Statements. For all IBM-PC compatibles & networks.

**EASY TO USE.** Fully Menu-driven, with Help Screens for each program. Friendly illustrated manual. Hot-line telephone support offered.

**CHEAP.** 3-month trial £19.95 (+p&p+VAT) = £26). Complete system £99.95 (+p&p+VAT) = £118). Single Ledgers and various options also available.

**RECOMMENDED.** By PC User, What Micro, and Amstrad Professional Computing magazines. Also in the journal of the NFSE&SB. Our 979 UK

"Accounts an accountant approves"

users, since 1980, include British Telecom, Shell, and Warner Lambert. Customer accounts have been audited and approved by Deloitte's Peat Marwick & Touche Ross.

**RELIABLE & FLEXIBLE.** Pure super-efficient 'C' programs. Guaranteed to be reliable.

# X-BUFFER FROM MICRO CONTROL SYSTEMS FOR ALL THOSE WHO'VE GOT BETTER THINGS TO DO WITH THEIR PC

## THAN WAIT FOR THEIR PRINTER

minutes to get on with something far more constructive.

### VERSATILITY

Until recently printer buffers had to be specified according to the type of PC and the printer used and the interfaces each had. The X-Buffer is designed for maximum flexibility and incorporates four interfaces: RS232 Serial i/o and Centronics parallel i/o.

The interfaces can be used simultaneously so the buffer can be used in a variety of ways. Two computers sharing one output device (printer, plotter, modem). One computer driving two devices. Two computers using two devices.

### EXPANDABILITY

The X-Buffer is also easily expandable by the user, plug-in memory modules offering from 64K to 4 Mbytes of buffer memory.

That's not only good news for users but great news for dealers too — instead of holding large stocks of varying fixed capacity buffer units, the X-Buffer modules allow custom configuration depending on the users' needs.

### EXTRAORDINARY VALUE

And the price of the X-Buffer is probably the best feature.

FROM  
**£159**

The 64K basic unit costs a mere £159 RRP including a standard two year parts and labour warranty.

X-Buffer from Micro Control Systems. Don't let your printer (or plotter or modem) keep you waiting.

The X-Buffer is just one of a range of buffer products manufactured and supported in the U.K., available from Micro Control Systems.

# micro

control systems

on 0602 391 204

Imagine you've got a 30 page report on your PC. The average printer will take about 17 minutes to print out, during which time your PC is either completely incapacitated or operating far slower than usual.

So, what can you do?

With the MCS X-Buffer, lots.

### WHY THE PROBLEM?

A printer operates at a slower rate than a computer, forcing the PC to wait whilst the printing job is completed. And with a plotter producing a complex CAD schematic, that could be several hours, not minutes. Fine if you've got time to waste — but most of us haven't.

### WHAT IS THE X-BUFFER?

X-Buffer is an intermediate storage device that acts as an extension to the computer's own memory. It allows text or data to be downloaded in seconds and 'held' in the buffer ready to be fed to the printer at the correct rate.

So there's no waiting for printing to finish, the PC is free to be used for other tasks.

In the case of your 30 page report, downloading to the X-Buffer would take around 28 seconds, leaving you 16 1/2

AVAILABLE FROM **Northamber** 01-391 2066

& WESTWOOD WESTREX 01 578 0959

# "It's a pretty small battery-powered PROM programmer – so what?"

Tools which are convenient get used a lot – that justifies their existence. There is no way we could explain all the usefulness of S3 here. Instead, if you're interested we're going to let you see it, use it and evaluate it in your own workshop. We went to a lot of trouble to design S3 just the way it is – no other PROMMER is all CMOS and all SMT. So we must be convinced that S3 would be a formidable addition to your armoury. Now all we have to do is to convince you.

## "Such a little thing can't be powerful, like a big bench-programmer – er – can it?"

Yes, it can. It is more powerful. S3 leaves other prommers streets behind. S3 has continuous memory, which means that you can pick it up and carry-on where you left off last week. S3 has a huge library EPROMS and EEPROMS. S3 can blow a hundred or more PROMS without recharging. S3 also works remotely, via RS232. There's a DB25 socket on the back. All commands are available from your computer (through a modem, even). Also S3 helps you develop and debug microsystems by memory-emulation.

## "What's this memory-emulation, then?"

It's a technique for Microprocessor Prototype Development, more powerful than ROM emulation, especially useful for single-chip "piggy back" micros. You plug the lead with the 24/28 pin header in place of the ROM/RAM. You clip the Flying-Write-Lead to the microprocessor and you're in business. The code is entered using either the keyboard or the serial interface. Computer-assembled files are downloaded in standard format – ASCII, BINARY, INTELHEX, MOTOROLA, TEKHEX.

Your microprocessor can WRITE to S3 as well as READ. You can edit your variables and stack as well as your program, if you keep them all in S3.

S3 can look like any PROM up to 64K bytes, 25 or 27 series. Access is 100ns – that's really fast. Memory-emulation is cheap, it's universal and the prototype works "like the real thing".

**S3 loads its working programs out of a PROM in its socket, like a computer loads from disk. Software expansion is unlimited. Upgrades will come in a PROM. Programs can be exchanged between users. How's that for upgradability?**

## "Can I change the way it works?"

You surely can. We keep no secrets. System Variables can be "fiddled." New programming algorithms can be written from the keyboard. Voltages are set in software by DACs. If you want to get in deeper, a Developers' Manual is in preparation which will give source-code, BIOS calls, circuit-diagrams, etc. We expect a lively trade in third-party software e.g. disassemblers, break-point-setters and single-steppers for various micros. We will support a User Group.

## "I'm bound to let the battery go flat."

Quite so. But in practice it doesn't matter. S3 switches off after a half-hour of non-use anyway, or when the battery gets low. You don't lose your data. Then a slow-charge overnight or boost-charge for three hours will restore full capacity. You can keep using it when charging. So there really is no problem.

## "I already have a programmer."

Pity it doesn't have S3 features, eh? But here's a trick worth knowing. If you plug S3's EMULead into the master socket of a ganger then you get an S3 with gang capacity. Isn't production separate from development anyway?

## "It looks nice. Will I be disappointed?"

Dataman tools are designed to be used by Engineers. Not just sold to Management. Have you ever been misled by some mouthwatering ad for a new product? Great artwork and exciting promises which feed your fancy? On impulse you buy and when the thing arrives you feel let down. The picture looked better. The claims are hardly justified; not exactly misrepresentation, just poor implementation. But you've bought it. And you're stuck with it. It stays in the cupboard, most of the time. So how about this: buy S3 and use it for up to a month. If you're not still thrilled then you can have your money back.

# Softy3 is here!

## "Refund in the first month! How can you offer that?"

We trust S3 to fire your enthusiasm. We trust you not to use us as a free hire-service. We bet you won't send it back. How would you manage without it?

## "These things cost a fortune and take months to arrive."

We wouldn't get you all excited and then let you down. It Costs £495 plus VAT. That includes P & P, Charger, EMULead, Write Lead and a HELP program in ROM. S3 is in stock. Buy it today. Use it tomorrow. (That's a fair promise. But please reserve product by phone or telex to make it come true).

If you purchase while this ad is current, you have 28 days to examine the goods and return them for refund. Carriage will be charged at cost. The right to charge the cost of refurbishment of damaged goods is reserved.

**HOW GOOD ARE TANDY COMPUTERS?  
ASK SOMEONE WHO'S  
BOUGHT TWO MILLION OF THEM.**

EVER SINCE we started making PCs, way back in 1977, Uncle Sam has had a long standing love affair with Tandy computers. ■

LAST YEAR alone, he bought over 600,000 of them, helping us become America's number one PC supplier and the world's 4th largest micro computer manufacturer. ■

HE LIKED the way all our desk top PCs were designed and built in his own back yard, Fort Worth Texas, and he wasn't just being patriotic. ■

WE'VE BEEN winning a reputation for sturdy construction and reliability all over the world. We even heard of a British company that left one of our PCs switched on for

three years before remembering to turn it off. ■

OF COURSE flexibility is as important as reliability, so we've put together a range of MS-DOS computers, designed for systems applications at every level whether it be the smallest data base or the most comprehensive spreadsheet. ■

THE 1000SX for instance has twin disk drives and a large memory, making it ideal for the company seeking a good value general purpose workhorse. ■

OR YOU may be looking for something a little more powerful for networking, in which case we have advanced machines like the 4000. Its blindingly fast 16 Mhz clock speed and vast expansion capabilities mean it's ready for anything, including OS/2. ■

AND IF you are a high flyer who likes to take work home, you can make life easier with the 1400LT. ■

A BIG memory and twin disk drives put this portable in the class of most PCs and with a backlit screen it can be used in situations where other portables just fade away. ■

NATURALLY we also make a complete range of printers to complement our computers,

1000 SX

4000

LP 1000

1400 LT PC

including a hi-tech but low cost laser printer. ■

BUT WE DON'T just sell technology, we also show you how to use it at our 46 "Business Point" stores. ■

COME IN, and you'll be greeted by qualified staff, not pushy salesmen; staff who have been trained to help the businessman choose the right solution to his business needs. They'll even help you with applications software, leasing and credit schemes. ■

OF COURSE you might just want hardware information, in which case come to any of our 230 high street stores. They'll be just as helpful as our Business Points, and they also carry a selection of Tandy computers and printers. ■

IF YOU'D like a brochure explaining some of our ideas and solutions for your business's problems, dial 100 and ask for Freephone Tandy Computers. ■

THEN NEXT time someone asks how good Tandy's computers are, Uncle Sam won't be the only one who can tell them. ■

# Tape Compatibility

IBM® PC

IBM PC/XT™

IBM PC/AT®

## Data Interchangeability

Everex extends its leadership in tape backup systems from the existing PC/XT/AT compatibles to the new PS/2 computer Models 30, 50, and 60. We are shipping new tape systems to provide you with complete backup protection against data loss resulting from disk failures.

The tapes recorded with PC/XT/AT compatibles using Everex software can also be read by your new PS/2 machines. Moreover, the data recorded at one site can be transported to a remote location for retrieval or can be safely stored for archival purposes.

## Multiple Models

Whether your preference is cassette or cartridge, we offer 12 different internal and external models ranging in capacity from 40MB to 125MB. If you currently have PC/XT/AT compatible computers, you may want an internal dedicated tape system. If you are switching to the new PS/2 computers, an external tape system may be ideal for your needs.

## Automatic

The world-renowned Scheduler™ program, included with our software, provides the priceless feature of backing up disk files at a predetermined time *Automatically*. Up to 8 events may be scheduled in advance so you do not have to be physically present to start the backup. The program even waits for you to complete your work before it initiates its operation.

EVEREX, EVER for EXcellence and Scheduler are trademarks of Everex Systems, Inc.  
IBM, PC/XT, PC/AT, and PS/2 are trademarks and registered trademarks of IBM Corporation.

IBM PS/2® Model 30

IBM PS/2 Model 50

IBM PS/2 Model 60

## Fast

Backup is performed at a streaming speed of up to 5MB/min so that even a 40MB disk can be backed up in less than 10 minutes!

## Reliable

The built-in data verification in the QIC-24 format assures data integrity. In case of an error, the data is automatically rewritten up to 16 times to insure its validity. Furthermore, the Everex tape software can optionally verify the data bit-by-bit for your complete satisfaction and peace of mind.

## The Total Solution

All systems are delivered with a drive, controller/adaptor, cables, software, manual and a tape cassette/cartridge. The whole works for a small price! And our products are sold with a 1-year warranty of parts and labor. Our fully trained technical support staff is ready to assist you with any questions.

# NEW LOW PRICE ST!

## ONLY FROM SILICA

Finally, there's a personal computer that not only solves problems like other computers, but also solves the one problem that other computers have created. Affordability. Silica Shop are pleased to present the ST range of personal/business computers from Atari. The ST was designed utilizing the most recent breakthroughs in semiconductor technology, producing a personal computer that performs tasks with fewer parts. Which means it costs less to make. And less to buy. The latest ST computers now include built in power supplies and built in disk drives. The TOS operating system and GEM window environment are now on ROM chips which are already installed in the ST keyboard. This enables automatic instant booting when you switch on. Silica Shop are pleased to offer the complete Atari ST range. Our mail order department is situated in Sidcup and we have 3 retail outlets at Sidcup, Lion House (Tottenham Court Rd) and Selfridges (Oxford Street). We have eight years experience of Atari products, longer than any other UK company, and are well established as the UK's No.1 Atari specialist. With a group turnover of over £9 million and in excess of 80 staff, we offer you unbeatable service and support. We provide several facilities which you will find invaluable during your Atari computing life and most of these facilities are available ONLY FROM SILICA. We suggest that you read through what we have to offer, before you decide where to purchase your Atari ST.

### FREE STARTER KIT - Only From Silica

When you purchase any Atari ST keyboard, you will not only receive the best value for money computer on the market, but you will also receive the following from Atari Corporation as part of the package:  
 \* BASIC Language Disk \* BASIC Manual \* ST Owners Manual \* TOS/GEM on ROM  
 If you buy your ST from Silica Shop, you will also receive:  
 \* NEOchrome Sampler - colour graphics program \* 1st Word - Word Processor  
 In addition, we at Silica would like to see you get off to a flying start with your new computer, so we have put together a special ST STARTER KIT worth over £100, which we are giving away FREE OF CHARGE with every ST computer purchased at our normal retail prices. This kit is available ONLY FROM SILICA and is aimed at providing users with a valuable introduction to the world of computing. We are continually upgrading the ST Starter Kit, which contains public domain and other licensed software, as well as books, magazines and accessories all relevant to ST computing. Return the coupon below for full details.

### DEDICATED SERVICING - Only From Silica

At Silica Shop, we have a dedicated service department of seven full time Atari trained technical staff. This team is totally dedicated to servicing Atari computer products. Their accumulated knowledge, skill and experience makes them second to none in their field. You can be sure that any work carried out by them is of the highest standard. A standard of servicing which we believe you will find ONLY FROM SILICA in addition to providing full servicing facilities for Atari ST computers (both in and out of warranty), our team is also able to offer memory and modulator upgrades to ST computers.  
**1Mb RAM UPGRADE:** Our upgrade on the standard Atari 520ST-M or 520ST-FM keyboard will increase the memory from 512K to a massive 1024K. It has a full 1 year warranty and is available from Silica at an additional retail price of only £86.96 (+VAT = £100).  
**TV MODULATOR UPGRADE:** Silica can upgrade the 1040ST-F to include a TV modulator so that you can then use it with your TV set. This is an internal upgrade and does not involve any untidy external boxes. A cable to connect your ST to any domestic TV is included in the price of the upgrade which is only £49 (inc VAT). The upgrade is also available for early 520ST computers at the same price.

### THE FULL STOCK RANGE - Only From Silica

We aim to keep stocks of all Atari related products and our warehouse carries a stock of over £3 million. We import many software titles direct from the USA and you will find that we have new releases in advance of many of our competitors. Unlike dealers who may only stock selected titles, we have the full range. In addition, we carry complete sets of all books, which have been selected from the Atari ST. A range as wide as ours is something you will find available ONLY FROM SILICA.

### AFTER SALES SUPPORT - Only From Silica

Rest assured that when you buy your ST from Silica Shop, you will be fully supported. Our free mailings give news of releases and developments. This will help to keep you up to date with new software releases as well as what's happening in the Atari market. And in addition, our sales staff are at the end of a telephone line to service all of your Atari requirements. If you purchase an ST from Silica and would like any technical advice, we have a full time technical support team to help you get the best from your computer. Because we have both the staff and the systems specifically dedicated to providing after sales service on Atari ST computers, we are confident that our users enjoy an exceptionally high level of support. This can be received ONLY FROM SILICA.

### FREE CATALOGUES - Only From Silica

At Silica Shop, we recognise that serious users require an in-depth information service, which is why we mail free newsletters and price lists to our ST owners. These are up to 48 pages long and are crammed with technical details as well as special offers and product descriptions. If you have already purchased an ST and would like to have your name added to our mailing list, please complete the coupon & return it to us. This information service is available ONLY FROM SILICA.

### FREE OVERNIGHT DELIVERY - From Silica

Most orders are processed through our computer within 24 hours of receiving them. Most hardware orders are sent by the overnight GROUP 4 courier service FREE OF CHARGE to customers within the UK. This method helps to ensure minimum delay and maximum protection.

### PRICE MATCH - Only From Silica

We hope that the combination of our low prices, FREE UK delivery service, FREE Starter Kit and FREE after sales support, will be enough to make you buy your Atari equipment from Silica Shop. If however, there is something you wish to purchase, and you find one of our competitors offering it at a lower price, then please contact our sales department, providing us with our competitor's name, address and telephone number. If our competitor has the goods in stock, we will normally match the offer (on a same product - same price basis) and still provide you with our normal free delivery. We realise that we are not the only company who will match a competitor's price. However, if you come to us for a price match, you will also be entitled to our after sales service, including free newsletters and technical support. This makes our price match promise rather special, something you will receive ONLY FROM SILICA. We don't want you to go anywhere else for your Atari products. So shop at Silica, the UK's No1 Atari Specialist.

# £260 +VAT=£299

## SO MUCH FOR SO LITTLE!

There is nothing that can compare with the incredible value for money offered by Atari's 520ST-FM. For only £260 (+VAT=£299), you can purchase a powerful 512K RAM computer, with a 95 key keyboard (including numeric keypad), MIDI interface, GEM, a palette of 512 colours, mouse controller, and a 512K built-in disk drive. The 520ST-FM has a TV modulator built-in, and comes with a lead to allow you to plug it straight into any domestic colour television set. The mains transformer is also built-in to the keyboard, so there are no messy external boxes. You couldn't wish for a more compact, powerful and stylish unit. Atari ST computers are now firmly established in the UK, there are nearly 500 software titles already available for a wide variety of applications and the list is growing all the time. And that's not all. When you buy your new 520ST-FM (or any Atari ST computer) from Silica Shop, you will get a lot more, including a FREE Silica ST Starter Kit worth over £100. Read the ONLY FROM SILICA section on the left, to see why you should buy your new high power, low price 520ST-FM from Silica Shop, the UK's No1 Atari Specialists. For further details of the range of Atari ST computers and the FREE Silica ST Starter Kit, complete and return the reply coupon below.

**ATARI 520ST-FM NOW ONLY £260 (+VAT=£299)**  
 520ST-FM with 512K RAM & mono monitor £399 (inc VAT) Upgrade from 512K RAM to 1024K RAM £100 (inc VAT)

### ATARI 1040ST-F - NEW PRICE

We are pleased to announce a new reduced price point on the 1040ST-F which is now available for only £499 (inc VAT). The 1040 is a powerful computer with 1Mb of RAM and also includes a built-in 1Mb double sided 3 1/2" disk drive. The 1040 has been designed for use on business and professional applications most of which require a high resolution monochrome or colour monitor. It does not therefore have an RF modulator for use with a domestic TV set. Modulators can be fitted for £49 (inc VAT).  
 1040ST-F Keyboard - Without Monitor £499 (inc VAT)  
 1040ST-F Keyboard + High Res SM125 Mono Monitor £599 (inc VAT)  
 If you would like further details of the 1040ST-F, return the coupon below.

### MEGA ST's NOW IN STOCK

For the user who requires even more RAM than the 520 or 1040 ST's offer, the new MEGA ST computers are now available. There are two MEGA ST's, one with 2Mb of RAM and the other with a massive 4Mb. Both new computers are fully compatible with existing ST's and run currently available ST software. The MEGA ST's are styled as an expandable Central Processing Unit with open architecture and a detachable keyboard. They are supplied with GEM, a free mouse controller and all extras as with the 520 or 1040. Prices are as follows:  
 MEGA ST 2Mb Keyboard + CPU £899 (inc VAT)  
 MEGA ST 2Mb Keyboard + CPU + SM125 Mono Monitor £999 (inc VAT)  
 MEGA ST 4Mb Keyboard + CPU £1199 (inc VAT)  
 MEGA ST 4Mb Keyboard + CPU + SM125 Mono Monitor £1299 (inc VAT)  
 If you would like further details of the MEGA ST's, return the coupon below.

- 200 Watts Switching Power Supply
- User selectable between RAM/ROM BIOS

Continental Systems, Inc., is the corporation dedicated to one major principle: To engage all resources in providing a complete solution to the needs of our OEM customers. While many manufacturers perform OEM work as a sideline, we devote our entire effort to the OEM business.

For companies demanding expert design capabilities and high quality manufacturing in the field of computers, peripherals, and desktop publishing products, Continental's uncompromising standards and comprehensive line of products guarantee a competitive edge in the changing market.

The Steinic P-2100 is Continental's latest 32-bit 386 computer system. With its unique interleaved memory circuitry, the P-2100 makes possible zero-wait-state memory access for up to 5MB of RAM, and gets a Dhrystone speed index rating of 3400. This blazing speed gives you minicomputer performance at PC/AT investment level. Users who insist on state-of-the-art technology at moderate prices will find the P-2100 everything that they could ask for.

## 800 x 600 EGA

**CAD/CAM**

**DESKTOP  
PUBLISHING**

- 100% Multisync Compatible
- CGA DoubleScan (just like IBM's new VGA!)
- Drivers for AutoCAD, Windows, GEM, Ventura, Pagemaker and more.
- 100% IBM EGA Compatible
- 132 Column Drivers for Lotus 1-2-3 and Symphony
- 80 x 66 for Desktop Publishing

*Genoa's SuperEGA™ board is the easiest way to get the best out of your high-resolution monitor—and the popular CAD/CAM and desktop publishing programs. And, SuperEGA also supports CGA, CGA DoubleScan (to 640 x 400), MDA, Hercules, and EGA, thanks to Genoa's exclusive AutoSync™ capability. So now you can get high performance at a reasonable cost—and look sharp!*

## PC-LabCard SERIES

Lab, Industrial and Engineering I/O Cards for IBM PC/XT/AT

**Data Acquisition & Control  
Lab Automation  
Engineering Tool, Education**

"PC-LabCard" is a family of add on cards to turn  
your PC into a high performance data  
acquisition/testing system at attractive prices.

It includes not only the hardware cards,  
but also the software,  
accessories and application support  
packages which come together to make a  
thoughtful solution to  
your PC-based automation needs.

# Semaphore cards

## For high quality and reliability.

### 2Mb MEMORY CARD

Memory board for the PC AT offering upto 2Mb of Extended Memory and full compatibility with the Lotus/Intel Expanded Memory Specification

- ◆ 12MHz running speed
  - ◆ Extended or EMS memory selectable
  - ◆ Configurable start address at 512K, 1Mb, ... 16Mb
  - ◆ Software Zero K installed
- Add £60 for each 512K memory (120ns)

£149

2Mb Memory Card for the PC, XT available at £129

### 3Mb MULTIFUNCTION CARD

Multifunction card for the PC AT offering standard I/O functions and up to 3Mb of Extended Memory

- ◆ Fully socketed memory
- ◆ Configurable start address at 256K, 512K, 1Mb, ... 16Mb
- ◆ 1 serial port, 2nd optional
- ◆ 1 parallel printer port
- ◆ Game port

Zero K installed  
Add £60 for each 512K memory (120ns)  
Add £15 for 2nd serial port

£175

### MULTI I/O CARD

A short size card providing fully configurable standard I/O functions

- ◆ Short card 4 x 5"
- ◆ Parallel printer port
- ◆ One serial port, 2nd optional
- ◆ Clock-calendar with battery backup
- ◆ Game port

Add £15 for 2nd serial port

£69

### 1200/1200 MODEM SHORT CARD

Remarkable high performance half-size modem card

- ◆ CCITT V22/V21 Full Duplex and Bell 212A/103 compatible
- ◆ Software compatible with Hayes Smartcom II and AT command set
- ◆ Auto dial & Auto answer
- ◆ Selective COM1-COM4 port
- ◆ Built-in speaker
- ◆ Fail-safe line protection circuit

£99

Non Telecom approved.

### EGA MULTIMODE CARD

Powerful Multimode Graphics Short Card to satisfy all your display requirements

- ◆ Supports IBM EGA, CGA, MDA & Hercules displays
- ◆ Supports 640 x 400 CGA
- ◆ Supports 640 x 480 graphics on a Multisync monitor
- ◆ 132-column & PGA drivers
- ◆ 256K video memory
- ◆ Flicker free display

£129

### 4Mb MEMORY CARD

Extended Memory card for the PC AT offering up to 2Mb on main board with a further 2Mb on piggyback board

- ◆ Configurable start address at 256K, 512K, 1Mb, ... 16Mb
  - ◆ Fully socketed memory
  - ◆ Zero K installed
- Add £60 for each 512K memory (120ns)

£175

### ETHERNET CARD

Intelligent High speed 10Mbits/sec Network Card with on-board 80186 processor

- ◆ Network technique: IEEE 802.3 CSMA/CD
- ◆ Topology: distributed bus, baseband
- ◆ 82586 LAN co-processor
- ◆ Protocol is in the firmware
- ◆ Power on diagnostic
- ◆ NETBIOS level compatible
- ◆ Network programs supported
- ◆ NetWare, PC-NET and MS-NET

£345

### MONO GRAPHICS SHORT CARD

High resolution graphics for your monochrome display monitor

- ◆ Short card 4x6"
- ◆ Text mode: 80x25
- ◆ Graphics mode: 720x348
- ◆ One parallel printer port
- ◆ Full compatibility with Hercules monochrome graphics card

£69

### COLOUR GRAPHICS SHORT CARD

Colour/Graphic Adaptor, fully compatible to IBM's

- ◆ Text mode: 40x25 80x25
  - ◆ Graphics mode: 320x200 2 colours  
640x200 4 colours
  - ◆ Composite video ports
- Add £10 for printer port

£59

### 384K MEMORY CARD

The cost effective solution for filling out the base memory on your PC, XT

- ◆ Short card 4x5"
  - ◆ Uses 64K and 256K chips
  - ◆ Configurable start address
  - ◆ High reliability
- 384K installed

£89

Other Cards in range

384K Memory Card + Multi I/O (XT) @ £149

Floppy Controller + Multi I/O (XT) @ £89

Hard Disk Controller (XT) @ £79

Hard/Floppy Controller (AT) @ £125

Multi Serial Card 4 port @ £119

Dual Serial Card RS422/232 @ £89

4Mb Memory Card ØK (Model 50/60) @ £175

We offer a full 12 months warranty and if you have any problems or questions you can call us for Technical Support.

## BACK-UP CONSULTANCY SERVICE

A lot of people came to us for data recovery even though they had a back-up. The trouble is, it didn't work when they needed it.

We'd prefer to show you how to set up a first class back-up system than try to recover your data after a disaster.

We'll advise on hardware, software and most importantly procedures

Ring (02403) 4201

## DR SOLOMON'S £10 SOFTWARE

### DR SOLOMON'S DATA RECOVERY SERVICE

We can tackle anything!

Phone us if you've lost data, and never assume we can't help you. We can do things you thought were impossible.

We can rescue data from hard disks, floppy disks, tapes and cartridges; whether they are formatted, corrupted have bad directories or even claim not to be there.

Deleted files and directories are our meat and drink.

Its not cheap, - but no fix no fee.

Phone for a quote. (02403) 28095

# COMPLETE COMMUNICATIONS SOFTWARE

**FOR IBM PC XT AT  
PS/2 AMSTRAD PC  
SIRIUS & APRICOT**

### EASE OF USE:

TRANS-SEND is very easy to use. It features POPUP menus, many HELP SCREENS and a user definable menu. From this menu, the user may dial and log on (etc) at the press of a single key.

### MODEMS:

TRANS-SEND operates with almost any type of modem, including HAYES (tm) and non-buffered 1200/75 manual modems. Autodial is supported, and Autodial protocol is user definable.

### VIDEOTEX EMULATION (PRESTEL)

TRANS-SEND offers full videotex (PRESTEL) on VGA, EGA, CGA, HERCULES, MDA, and AMSTRAD display types. The emulation is total - ALL Videotex features are fully implemented\*. The display is full screen or split screen. In split screen mode, you can view two Videotex pages at once, or have a HELP screen in view as well. Pages can be printed and saved in a choice of formats.

DATAMASKING allows quick and easy retrieval of data to a database or spread-sheet application.

MAILBOXES may be created offline, and later uploaded.

SOFTWARE DOWNLOAD is supported too.

### TERMINAL EMULATIONS:

TRANS-SEND emulates VT102, VT100, VT52, ANSI, VIDEOTEX and plain TTY terminals. Graphics, function keys, and even keypad application mode are supported. The LEDs of the DEC(tm) terminal are reproduced on screen.

TRANS-SEND offers extra features via its POPUP menus from these terminal emulations.

### FILE EXCHANGE:

TRANS-SEND offers SLIDING WINDOWS KERMIT, XMODEM, ASCII, Software Download, and its own protocol.

### COMMAND FILES:

TRANS-SEND can be fully automated by use of its COMMAND FILE language. This powerful language supports labels, conditional branches, nested subroutines, etc. COMMAND FILES can be loaded and executed with the press of ONE key from the user defined menu. ALL TRANS-SEND operations can be automated by COMMAND FILES.

### DISK BACKUP:

TRANS-SEND can move groups of files quickly and easily between computers. This offers an excellent method of backing up one hard disk onto another in a different computer. It can also move files between 5.25 and 3.5 inch formats, and APRICOT and SIRIUS formats.

### WORD EDITOR:

TRANS-SEND has its own built in text editor. This feature can create and edit text files up to 80 characters wide by 800 lines long.

### MS/DOS:

TRANS-SEND runs under MS/DOS version 2.00 or higher. It fully supports PATH names, and can execute any MS/DOS command line without a need to exit. It can remain memory resident via its SHELL option.

### LANGUAGES:

TRANS-SEND is available in ENGLISH, SWEDISH, DANISH, DUTCH and FINNISH. A version in ENGLISH but using the SWEDISH character set is available too. More languages will follow soon.

\* Colour needs a colour monitor.

**PRICE £49.95** + £2 P+P PLUS VAT

## FORTRANSOFT LTD

PROFESSIONAL SOFTWARE FOR THE IBM PC/XT/AT AND COMPATIBLES, eg. OLIVETTI, COMPAQ, AMSTRAD, OPUS ...

BASIC is fine for short programs and when speed and portability are not important. Besides, you can draw pretty pictures on the screen with BASIC. However, if you are writing large programs and wish to protect all the hours (in some cases years) you spent in writing your software then Fortran comes into its own. Whilst most languages are 'here today — gone tomorrow', Fortran, designed in the late fifties, still remain the dominant language for scientific and general purpose programming today. This means that programs you write today will work tomorrow on future generation of machines with little or no change.

Fortransoft now brings you an affordable ANSI 77 Fortran Compiler. And you can still draw pretty pictures on the screen because the GRAPHKIT library comes with the compiler and is included in the price.

**FS-Fortran 77** is now at level 3.17 (with 8087 support) and current users may obtain a copy of the compiler for £2 all incl.

**FS-Fortran 77** with CGA and EGA colour graphics routines.....**£34.95**  
(suitable for PC1512/PC1640)

**FS-Fortran 77** with CGA and Hercules mono graphics routines .....**£39.95**  
(suitable for PC1640 mono graphics)

**FS-Fortran 77** with CGA and Olivetti 640x400 graphic routines.....**£39.95**

**FS-Fortran 77** with CGA, EGA, VGA and Herc, mono graphics .....**£49.95**

**FS-GRAPHKIT** is a comprehensive suite of graphics and sound routines, including routines for drawing lines, circles, ellipses, painting, read/write to port, get time and date, reading a single key from the keyboard, screen dump, etc

**FS-GRAPHKIT** is available for use with Microsoft Fortran, Ryan McFarland Fortran, IBM Professional Fortran, Lattice C, Zorland C, Prospero Fortran 77, and Microsoft Optimising Compiler. (Please specify which compiler when ordering).

CGA and EGA colour graphics.....**£19.95**

CGA and Hercules mono graphics.....**£24.95**

CGA and Olivetti 640x400 graphics.....**£24.95**

CGA, EGA VGA and Hercules mono graphics.....**£34.95**

**FS-Sortmerge** is a suite of Fortran-callable routines for sorting/merging an unlimited number of records on multiple keys. Any combination of alphabetic and numeric keys may be specified.

**FS-Sortmerge** for **FS-Fortran 77** Compiler .....**£24.95**

**FS-Sortmerge** for Microsoft Fortran Compiler .....**£24.95**

**FS-Sortmerge** for Ryan Mc Farland/IBM Professional Fortran .....**£24.95**

**FS-Sortmerge** for Prospero Fortran77 .....**£29.95**

Fortransoft acknowledges all trademarks and registered names in this advert. Please indicate Compiler and Computer type when ordering. All prices include packing, postage and VAT. Please add £3 for delivery outside Europe. All software comes on 5.25" 360k/1.2M (please specify). COD's and purchase orders are NOT accepted. Overseas dealer enquiries welcome. Send cheque with order to: (or write for further details)

# ARE YOU MAKING ENOUGH MONEY ON THE STOCKMARKET? . . . . . . with our Software, your computer could make you more!

'ShareMaster is a valuable piece of software . . . its analysis option can even improve your performance sufficiently to pay for itself in a reasonable space of time' - Which PC

'The program represents value for money which does not seem to be equalled in its field' - Acorn User

ShareMaster is a powerful and easy to use integrated investment system for the analysis of price trends, investment performance and portfolio profitability. The package employs a comprehensive range of advanced predictive and analytical measures to help you improve the timing and success of investment decisions.

ShareMaster's portfolio management features have been designed to meet the varying needs of private and professional investors. The charting features alone can be found only on systems costing many times the purchase price.

### MAIN FEATURES . . .

- \* Profit Analysis facilities include Valuation, Profit Statements, Performance Reporting, Profit Analysis, etc.
- \* Predictive features include moving averages, log/linear scaling, point & figure, linear regression, curve smoothing, relative strength, comparisons, momentum, Rate of Change, stochastics, trendlines, etc.
- \* ShareMaster can maintain an extensive database of share price and purchase/sale/dividend information which can be rapidly updated, amended or displayed as required. Transactions can be entered on behalf of one or more parties and valuation/profit statements produced in seconds.
- \* ShareMaster is exceptionally easy to use and is supplied with a 96-page manual which includes sections on interpreting the predictive indicators provided and their use in investment strategy.

These are only a fraction of the facilities offered. ASK FOR OUR FREE COMPREHENSIVE BROCHURE.

'A sophisticated combined portfolio and price graphics program . . . comprehensive and easy to follow' - Investors Chronicle

'There's no reason why ShareMaster shouldn't grace the portfolio of every interested investor' - Complete Guide to the Amstrad PCW

We believe that no other investment package can match ShareMaster's combination of facilities, performance, flexibility, ease of use and price. We are confident that investors will find it an indispensable aid, one which should repay your investment many times over.

ShareMaster is available for most popular computers including: Amstrad/IBM PC/XT/AT and compatibles BBC Model B and Master Amstrad CPC 6128, PCW 8256, 8512, 9512 Atari 520 ST

Now available - our most advanced investment analyst . . .

ShareMaster Plus offers a higher level of convenience and flexibility in addition to providing more powerful charting and portfolio analysis features. These include the ability to automatically extract prices from the Prestel Citiservice 'Fund Manager' price feed. Ask for further details on the range of additional features offered.

Amstrad/IBM PC/XT/AT and compatibles only.

**New Release - OptionsMaster.** A traded options valuation and analysis package. Ask for details.

**ORDER FORM** - Prices include VAT, p&p, etc. Orders normally despatched within 24 hours. Overseas orders deduct VAT but add £7 (Europe) or £10 (rest of world) for airmail despatch. Cheque, Access, Visa orders accepted. When ordering, please state your computer type. Dealer enquiries welcome.

Dell Computer Corporation is getting worried that it is being considered in the same breath as Damart, Great Universal Stores and South Bucks Rainwear as a 'mail order' company. Now, while no-one is likely to confuse Michael Dell's 386 machine with a pair of thermal long-johns, his company is nonetheless keen to distance itself from these more intimate merchandisers. But we don't think its new nomenclature is any the less tinged with 'personal' connotations. Dell now says it is engaged in 'direct relationship marketing', which makes it sound like the company is running a marriage bureau. Next, we'll get letters from Dateline saying it is really in the computer business...

NCR is concerned that we ran a Benchtest of 386 towers when it has marketed its own NCR Tower machines for some time, and even trademarked the word 'Tower'. This little-known legal claim is set to have far-reaching consequences. We look forward to hearing of the renaming of some famous landmarks such as the 'leaning floor-standing bell tower of Pisa'; London's 'Post Office under-the-desk-communications centre'; and New York's twin 'World Trade very tall buildings'. Good luck, NCR...

The Americans have a wonderful love of coining new words, even if their meaning is not quite what is meant. Waiting to see a company executive recently, a colleague was told that the man in question would be with us 'momentarily'. Fortunately, the interview lasted longer than that...

Things must be getting very slippery for all those companies in the M4 corridor from London to Bristol who thought they were making computers. In the January edition of *Rail News*, BR announced that it had created four new supervisory posts to manage its network of trains running through 'Silicone Valley'...

A Lotus ad for its system centres was backed by a list of computer shows for 1988. Included for September was the *PC Week Show* at Olympia. So that's why VNU and show organiser, Montbuild, moved the Personal Computer World Show to Earls Court and renamed it The Personal Computer Show...

When a company offers a money-back guarantee that its products are compatible with an industry standard, it has to be careful of the wording. The latest Paradise VGA+ card is guaranteed to run 'all VGA software that will run on a genuine IBM VGA display adaptor fitted inside an IBM XT or AT.' What about software

running on the PS/2s? A bit too difficult?

Take the editor of the country's best computer magazine attending a meeting to demonstrate his latest database application. Mix in the marketing director of the company which publishes the generating program, and a leading rental company for IBM equipment. Result — a recipe for disaster. Editor arrives with 5 1/4in 1.2Mbyte disk containing application. Marketing director doesn't bring original database program. Machine sitting in corner is IBM PS/2 Model 50 with 3 1/2in 1.44Mbyte drives. 'No problem,' they all said. 'Let's call up the IBM dealer who supplied the machine and get an external 5 1/4in disk drive.' Dealer arrives with one 5 1/4in external drive — for 360k disks only. IBM doesn't manufacture a high-density external 5 1/4in disk drive. 'No-one seriously uses those disks for anything,' the dealer said in all seriousness. All of a sudden, all the other fools in the room felt much better...

This isn't really 'have a go at Ashton-Tate' month, but we couldn't believe our eyes when we received the Byline

demonstration disk. Byline is A-T's long-overdue desktop publishing product. You'd expect a demo disk to show you a demo of the product. Wrong. It is a fancy storyboard-type presentation with typical presentation graphics detailing how wonderful the product is. Not a sign of the product anywhere on the disk. Not even sample screens. Makes you wonder how the company managed to get away with the other thing about the disk that had us falling about. It costs \$4.95 to buy...

## This Month

Dell Computers can do no wrong. Its new System 200, reviewed in this issue, certainly represents better value than the company's existing range and provides higher performance. But we do wish someone would supply an entry-level machine that really was a switch-on-and-go OS/2 engine — with OS/2 already installed, and plenty of high-speed RAM already on the motherboard. See page 96 for how close Dell came.

This month *PCW* welcomes a new staff writer, Andy Redfern. He joins us from Warwick University where he was

doing work on medical image processing. He made his first significant contribution on only his second day by appearing on a BBC radio show to discuss the Amiga virus currently threatening the Commodore community.

Next month sees *PCW*'s Tenth Anniversary issue. As well as the usual crop of world exclusives, in-depth reviews and forward-looking features, we'll be offering you the opportunity to win valuable computer hardware and software, including an Acorn Archimedes and the latest Borland products. All you'll need to do is tell us what you think about *PCW*.

On a visit to Hong Kong's Golden Computer Arcade recently, *PCW*'s editor, Derek Cohen, found some real software bargains, including Ventura Publisher and dBaselll+, both at £14 including manuals and a full set of disks. Ironically, this was just a few weeks after Ashton-Tate in particular had made loud noises about cleaning up the piracy business in Hong Kong. The properly-printed and bound manuals have full-colour covers and, in the above products' case, are easier to use than the heavy ring-bound originals. Other bargains included a dBaselll+ LAN pack, also for around £15, and SCO Xenix for £25.

Despite Ashton-Tate's law enforcement, the pirates may still have the last laugh: inside the dBaselll+ manual it says: 'If you experience problems with this product, technical support is available from your local Ashton-Tate dealer'...

Phoenix the Panther wonders: Which lucky chap will be my breakfast and which lunch.

# Accountability.

ccountability ] sic. *responsible, liable.*  
 With a print speed of 480cps or rather 360 lines per minute the MP480 has a great accountability, ideal for invoice runs, statements, reports and much, much more. When you want fast throughput at an economical price you can't get better value for money. Furthermore, there is a whole family of Micro P matrix and daisywheel printers each tailored for individual needs, whether for home, business or educational use. This accounts for the fact that in a recent industry survey of matrix printers, the MP range

was voted as some of the best buys – another example of MP printers accountability.

For a copy of the best buys report and print samples contact:-  
 Exclusive Distributor:

**Micro Peripherals Ltd**
